

# Package ‘FIESTA’

January 19, 2023

**Type** Package

**Title** Forest Inventory Estimation and Analysis

**Version** 3.5.1

**Date** 2023-01-18

**Description** A research estimation tool for analysts that work with sample-based inventory data from the U.S. Department of Agriculture, Forest Service, Forest Inventory and Analysis (FIA) Program.

**Depends** R (>= 4.0)

**Imports** data.table, DBI, FIESTAutils (>= 1.1.4), grDevices, graphics, methods, rgdal, RSQLite, sf, sqldf, utils, largeList

**Suggests** knitr, raster, rmarkdown

**VignetteBuilder** knitr

**License** GPL-3

**Copyright** See file COPYRIGHTS for details.

**LazyData** true

**SystemRequirements** C++11

**Encoding** UTF-8

**RoxygenNote** 7.2.3

**NeedsCompilation** no

**Author** Tracey Frescino [aut],  
Gretchen Moisen [aut],  
Paul Patterson [aut],  
Chris Toney [aut],  
Grayson White [aut, cre] (<<https://orcid.org/0000-0003-4993-2792>>)

**Maintainer** Grayson White <graysonwhite13@gmail.com>

**Repository** CRAN

**Date/Publication** 2023-01-18 23:30:03 UTC

FIESTA-package

*FIESTA - Forest Inventory Estimation for Analysis*

---

### Description

FIESTA is a research estimation tool for analysts that work with sample-based inventory data from the U.S. Department of Agriculture, Forest Service, Forest Inventory and Analysis (FIA) Program.

### Details

FIESTA can generate FIA's traditional state-wide estimates while also accommodate: unique population boundaries, different evaluation time periods, customized stratification schemes, non-standard variance equations, integration of multi-scale remotely-sensed data and other auxiliary information, and interaction with other modeling and estimation tools from CRAN's library of packages.

FIESTA contains a collection of functions that can query FIA databases, summarize and compile plot and spatial data, and generate estimates with associated sampling errors.

datBarplot

*Data - Generates frequency barplot.*

---

### Description

Generate a barplot of from a frequency data frame.

**Usage**

```
datBarplot(  
  x,  
  xvar = NULL,  
  yvar = "FREQ",  
  grpvar = NULL,  
  errbars = FALSE,  
  x.order = NULL,  
  sevar = NULL,  
  psevar = NULL,  
  device.type = "dev.new",  
  jpeg.res = 300,  
  device.height = 5,  
  device.width = 8,  
  horiz = FALSE,  
  toplabelvar = NULL,  
  ylim = NULL,  
  divideby = NULL,  
  ylabel = NULL,  
  xlabel = NULL,  
  mar = NULL,  
  addlegend = FALSE,  
  main = NULL,  
  cex.main = 1,  
  cex.label = 1,  
  cex.names = 0.8,  
  las.xnames = 0,  
  las.ynames = 1,  
  savedata = FALSE,  
  outfolder = NULL,  
  outfn = NULL,  
  outfn.pre = NULL,  
  outfn.date = TRUE,  
  overwrite = FALSE,  
  ...  
)
```

**Arguments**

x	Data frame or comma-delimited file (*.csv) - a frequency table.
xvar	String. Name of X variable.
yvar	String. Name of the y variable (e.g., FREQ).
grpvar	String. Name of the variable for grouping.
errbars	Logical. If TRUE, error bars are added to bar plot (sevar or psevar must also be populated).
x.order	String or Vector. Define order of xvar based on y values: descending ("DESC") or ascending ("ASC") or vector of row numbers. If NULL, the order of the input

	table is used.
sevar	String. Name of the variable with standard error values.
psevar	String. Name of the variable with percent standard error.
device.type	String. Type(s) of device for plotting ("dev.new", "jpg", "pdf").
jpeg.res	Integer. Resolution for jpeg image.
device.height	Integer. Height (in inches) of barplot, if writing to file.
device.width	Integer. Width (in inches) of barplot, if writing to file.
horiz	Logical. If TRUE, bars are drawn horizontally with first bar at the bottom. If FALSE, bars are drawn vertically with first bar to the left (barplot parameter).
toplabelvar	String. Name of variable in x for adding labels to place above each bar (e.g., NBRPLOTS.gt0).
ylim	Number. A vector of min and max values, c(min,max) for the y axis (or x axis if horiz=TRUE). If NULL, defaults to maximum y value. If errbars=TRUE, the ylim defaults to the maximum y value plus the standard error.
divideby	String. Conversion number for output ('hundred', 'thousand', 'million').
ylabel	String. Label for the y axis (same as ylab).
xlabel	String. Label for the x axis (same as xlab).
mar	See par.. A numerical vector representing number of lines for margins (c(bottom, left, top, right)).
addlegend	Logical. If TRUE, adds legend to bar plot (only applicable if grouping).
main	String. Title for plot.
cex.main	Number. Expansion factor for title.
cex.label	Number. A number representing cex in barplot (size expansion of x and/or y-labels).
cex.names	Number. Expansion factor for axis names (bar labels) (e.g., 0.5 represents half the size).
las.xnames	Number. The direction of x variable names (0,1,3). 0:diagonal (Default), 1:horizontal; 3:vertical.
las.ynames	Number. The direction of y variable names (0,1,3). 0:diagonal (Default), 1:horizontal; 3:vertical.
savedata	Logical. If TRUE, writes output data to outfolder (jpg and pdf).
outfolder	String. The name of the output folder. If savedata=TRUE, all output saved to the outfolder. If savedata=FALSE, only a text file of input parameters is saved.
outfn	String. The name of the output file if savedata=TRUE (*.csv). Do not include extension. If NULL, the file will be named BARPLOT_'yvar_date'.csv
outfn.pre	String. Add a prefix to output name (e.g., "01").
outfn.date	Logical. If TRUE, add date to end of outfile (e.g., outfn_'date'.csv).
overwrite	Logical. If TRUE and exportshp=TRUE, overwrite files in outfolder.
...	additional arguments to pass to barplot(), including a list of arguments for legend() arguments (e.g., args.legend=list(x="topleft", bty="n"), for moving legend to topleft and removing box around legend).

**Details**

If parameters = NULL, then it will prompt user for input.

**Value**

Outputs barplot to display window.

**Note**

If savedata = TRUE, writes a jpg and pdf of barplot to outfolder.

To add legend parameters, add a parameter named args.legend, defined as a list of specific legend parameters (see ?legend)... e.g., args.legend=list(x="topright"). If specifying x and y, x defines the lower right corner of legend box and y defines the upper right corner of box.

**Author(s)**

Tracey S. Frescino

**Examples**

```
# Set up data frame for example
ftyptab <- data.frame(cbind(FORTYPCD = c(182, 184, 201, 221, 265),
                           FREQ = c(110, 7, 900, 410, 155),
                           SE = c(10, 11, 18, 14, 22)))

# Create basic barplot
datBarplot(x = ftyptab, xvar = "FORTYPCD")

# Add standard errors to basic barplot
datBarplot(x = ftyptab, xvar = "FORTYPCD", errbars = TRUE, sevar = "SE")
```

---

datBarStacked

*Data - Generates frequency barplot.*

---

**Description**

Generate a barplot of frequencies in order from most to least.

**Usage**

```
datBarStacked(
  x,
  main.attribute,
  sub.attribute,
  response = "phat",
  percent = FALSE,
  LUT.color = NULL,
  color = "rainbow",
```

```

device.type = "default",
jpeg.res = 300,
device.width = 9,
device.height = 6,
mar = NULL,
horiz = TRUE,
bar.lim = NULL,
bar.ratio = 1,
ylabel = NULL,
xlabel = NULL,
las.xnames = NULL,
main.order = NULL,
sub.order = NULL,
legend.fit = NULL,
legend.cex = 0.8,
legend.x = NULL,
legend.y = NULL,
legend.title = NULL,
legend.bty = "o",
legend.bg = par("bg"),
legend.inset = 0,
legend.xpd = par("xpd"),
main = NULL,
cex.main = 1,
cex.label = 1,
cex.names = 0.8,
sub.add0 = FALSE,
savedata = FALSE,
outfolder = NULL,
outfn = NULL,
outfn.pre = NULL,
outfn.date = TRUE,
overwrite = FALSE,
...
)

```

### Arguments

x	Data frame or comma-delimited file (*.csv) - table of values to be plotted.
main.attribute	String. The column to be used for each bar.
sub.attribute	String. The column to be used to subdivide each bar.
response	String. The column of values to be plotted. Currently defaults to "phat".
percent	Logical. If TRUE, values cover values in a stack are converted to percent of stack.
LUT.color	Data frame or comma-delimited file (*.csv) - look up table for colors. Must contain column with same name as sub.attribute.
color	String. Automated color selection ("rainbow", "topo", "heat", "terrain", "cm").

device.type	String. The type(s) of device for plotting ("default", "jpg", "pdf", or "ps").
jpeg.res	Integer. The resolution for jpeg image.
device.width	Integer. The width of output device (in inches)'
device.height	Integer. The height of output device (in inches)'
mar	See par.. A numerical vector representing number of lines for margins (c(bottom, left, top, right).
horiz	Logical. See barplot. If FALSE, the bars are drawn vertically with the first bar to the left. If TRUE, the bars are drawn horizontally with the first bar at the bottom.
bar.lim	Number vector. Equivalent to xlim or ylim, for whichever is the lengthwise axis in barcharts (ex. c(0,10)). Warning: for lower limits other than zero (ex. c(20,100), will behave strangely because par(xpd) is set to NA.
bar.ratio	Proportion of figure area taken up by barplot vs taken by legend.
ylabel	String. A label for the y axis (same as ylab).
xlabel	String. A label for the x axis (same as xlab).
las.xnames	Number. The direction of x variable names (0,1,2,3). 0:Default, parallel; 1:horizontal; 2:perpendicular; 3:vertical.
main.order	String vector. A vector of main.attribute names in desired order for bars. May also be 'DESC' or 'ASC'.
sub.order	String vector. A vector of sub.attribute names in desired order for stack, with the first name used as the column in each stack. If NULL, the order is based on the overall cover of each sub.attribute. May also be 'DESC' or 'ASC'.
legend.fit	Logical. Should bar.lim be changed to fit the legend of the plot. Will only be used if the legend is on the right side of a horizontal plot or the top of a vertical plot. (i.e. horiz=FALSE).
legend.cex	Number. Expansion factor for legend text.
legend.x	See legend. The x coordinate to be used to position the legend. If horiz=TRUE, suggested options include "topright" or "bottomright". If horiz=FALSE, suggested options include "topleft" or "topright".
legend.y	See legend. The y coordinate to be used to position the legend.
legend.title	See legend. A title for the legend.
legend.bty	See legend. the type of box to be drawn around the legend.
legend.bg	See legend. The background color for the legend box.
legend.inset	See legend. The distance from the margins as a fraction of the plot region.
legend.xpd	See legend.
main	String. Title for plot.
cex.main	Number. Expansion factor for title.
cex.label	Number. A number representing cex in barplot (size expansion of x and/or ylabels).
cex.names	Number. Expansion factor for axis names (bar labels). Ex. 0.5 represents half the size.

sub.add0	Logical. If TRUE, adds categories with 0 values to sub.attribute legend.
savadata	Logical. If TRUE, writes output data to outfolder (jpg and pdf).
outfolder	String. The name of the output folder. If savadata=TRUE, all output saved to the outfolder. If savadata=FALSE, only a text file of input parameters is saved.
outfn	String. The name of the output file if savadata=TRUE (*.csv). Do not include extension. If NULL, the file will be named BARPLOT_'yvar_date'.csv
outfn.pre	String. Add a prefix to output name (e.g., "01").
outfn.date	Logical. If TRUE, add date to end of outfile (e.g., outfn_'date'.csv).
overwrite	Logical. If TRUE and exportshp=TRUE, overwrite files in outfolder.
...	list of additional arguments to pass to barplot(); names of the list are used as argument names.

### Details

# Note: This function uses a customized lengthwise axis (y axis if horiz=F, x axis if horiz=T) # Therefore to modify this axis by par commands (other than the # ones specifically included above) may require changing the function. For example par(yaxp) # may not work. # # # The arguments bar.lab and bar.lim are equivalent to xlab/ylab, xlim/ylim, controlling # whichever is the lengthwise axis in the bar charts (as determined by horiz). # # # bar.ratio is only used when bar.lim is specified, it controls what percentage of the # plot area will be occupied by the specified range of the chart itself. For example, setting # bar.lim=c(0,80) and bar.ratio=0.75 will result in the 80 region, leaving 25 the bars are taller than 80 bar.lim is not specified, the function will automatically scale the lengthwise axis so # that all the bars are as tall as possible, but none of the bars overlap the legend. # # The main purpose of specifying bar.lim is if you want multiple forest types to be shown at # the same scale, sacrificing individual forest type details to make the graphs comparable # across forest types. Then you may need to fiddle with bar.ratio till the plots all look good.

### Value

Outputs stacked barplot to display window.

### Note

If savadata = TRUE, writes a jpg and pdf of barplot to outfolder.

### Author(s)

Elizabeth Freeman, Tracey S. Frescino

---

datFilter	<i>Data - Filters data table.</i>
-----------	-----------------------------------

---

### Description

Subsets a data table by specified filter(s).

### Usage

```
datFilter(
  x,
  xfilter = NULL,
  xfiltervar = NULL,
  othertabnms = NULL,
  uniqueid = "PLT_CN",
  vardelete = NULL,
  title.filter = NULL,
  savedata = FALSE,
  filternm = NULL,
  stopifnull = FALSE,
  returnDT = TRUE,
  xnm = NULL,
  savedata_opts = NULL,
  gui = FALSE
)
```

### Arguments

x	Data frame, sf data frame or comma-delimited file (*.csv). A data frame to filter.
xfilter	String. A filter expression. Must be R syntax. (e.g., "STATUSCD == 1", "IN-VYR within double quotes (e.g., "SPP == 'Lodgepole'"). If NULL, a window pops up to select filter variable(s) and filter value(s).
xfiltervar	String. The filtervar if you know what it is. If NULL, a window will pop up to select filter value(s).
othertabnms	String vector. Name(s) of the objects or comma-delimited files to subset. Names must be in quotes (e.g., othertables=c('tree', 'cond')).
uniqueid	String. Unique identifier of x. Only needed if othertables != NULL. The uniqueid must be the same for all tables except if PLT_CN and CN.
vardelete	String vector. Vector of variables you would like deleted from filter list. Mostly used for internal queries.
title.filter	String. Title of the filter query window. Mostly used for internal queries.
savedata	Logical. If TRUE, writes output data to outfolder.
filternm	String. Optional. Name of filter, for feedback purposes.
stopifnull	Logical. If TRUE, stop if output is NULL.

returnDT	Logical. If TRUE, returns a data table. If FALSE, returns a data frame.
xnm	String. Name for filter attribute. Used for warning messages.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE. If out_layer = NULL, default = 'datf'.
gui	Logical. If TRUE, pop-up windows will appear for user-interface.

### Details

If no parameters, then user is prompted for input. If partial parameters, default parameter values are used.

### Value

A list of the following items:

xf	A data frame of filtered x.
xfilter	The xfilter.

If othertables != NULL, the other tables, named with 'in' prefix

### Note

If message returned is 'filter removed all records', either the filter removed all records in x or the filter is incorrect.

### Author(s)

Tracey S. Frescino

### Examples

```
# Set up data for example
tab <- data.frame(cbind(CONDCLASS=c(1, 1, 2, 1, 3, 3, 3, 1, 1, 1, 2, 1),
                        FORTYPCD = c(182, 184, 201, 221, 221, 184, 221, 182,
                                     182, 201, 182, 221)))

# Filter for value not equal to 182
datFilter(x = tab, xfilter = "FORTYPCD != 182")

# Filter on two conditions, grab xf object from list
datFilter(x = WYcond, xfilter = "FORTYPCD == c(221) & STDSZCD == 3")$xf
```

---

datFreq

*Data - Get frequency table for specified variable(s).*

---

### Description

Generates a frequency table from a data frame, including number of records by a specified variable or variables in the data frame with optional totals and/or subtotals.

### Usage

```
datFreq(
  x,
  xvar = NULL,
  total = FALSE,
  subtotal = FALSE,
  subtotalcol = NULL,
  savedata = FALSE,
  savedata_opts = NULL,
  gui = FALSE
)
```

### Arguments

x	Data frame or comma-delimited file (*.csv). The table with the variable(s).
xvar	String (vector).* The name of the variable(s) to summarize.
total	Logical. If TRUE, a row is added to bottom of table with a total for the whole table.
subtotal	Logical. If TRUE, a row is added to bottom of each section for subtotals.
subtotalcol	Logical. If subtotal=TRUE, the column(s) to generate subtotals.
savedata	Logical. If TRUE, writes output data to outfolder.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE. If out_layer = NULL, default = 'datfreq'.
gui	Logical. If TRUE, pop-up windows will appear for user-interface.

### Details

If no parameters, then user is prompted for input. If partial parameters, default parameter values are used.

### Value

freqtable      Data frame. The frequency table.

If savedata=TRUE, a comma-delimited file of the frequency table is written to the outfolder.

**Author(s)**

Tracey S. Frescino

**Examples**

```
# Set up data for example
tab <- data.frame(cbind(CONDCLASS = c(1, 1, 2, 1, 3, 3, 3, 1, 1, 1, 2, 1),
                        FORTYPCD = c(182, 184, 201, 221, 221, 184, 221, 182,
                                     182, 201, 182, 221)))

# Frequency table with "FORTYPCD"
datFreq(x = tab,
        xvar = "FORTYPCD")

# Frequency table with "CONDCLASS" and "FORTYPCD"
datFreq(x = tab,
        xvar = c("CONDCLASS", "FORTYPCD"))

# Frequency table with "CONDCLASS" and "FORTYPCD", adding total and subtotal
# rows
datFreq(x = tab,
        xvar = c("CONDCLASS", "FORTYPCD"),
        total = TRUE,
        subtotal = TRUE)

# Frequency table for WYtree, multiple variables, subtotal options
datFreq(x = FIESTA::WYtree,
        xvar = c("SPGRPCD", "SPCD", "STATUSCD"),
        subtotal = TRUE, subtotalcol = "SPCD")
```

---

**datLineplot***Data - Generates line graph.*

---

**Description**

Generate a line plot of multiple estimates.

**Usage**

```
datLineplot(
  x,
  xvar,
  yvar,
  plotCI = FALSE,
  sevar = NULL,
  CI1st = c(68, 95),
  CIColor1st = c("dark grey", "black"),
  addshade = FALSE,
  device.type = "dev.new",
```

```

jpeg.res = 300,
device.height = 5,
device.width = 8,
ylim = NULL,
divideby = NULL,
ylabel = NULL,
xlabel = NULL,
xticks = NULL,
mar = NULL,
addlegend = FALSE,
main = NULL,
cex.main = 1,
cex.label = 1,
cex.names = 0.9,
las.xnames = 0,
las.ynames = 1,
savedata = FALSE,
outfolder = NULL,
outfn = NULL,
outfn.pre = NULL,
outfn.date = TRUE,
overwrite = FALSE,
...
)

```

### Arguments

x	Data frame or comma-delimited file (*.csv) - a frequency table.
xvar	String. Name of X variable.
yvar	String. Name of the y variable (e.g., <code>FREQ</code> ).
plotCI	Logical. If <code>TRUE</code> , adds confidence intervals to plot as dotted lines.
sevar	String. Name of the variable with standard error values.
CI1st	String. Numeric vector. If <code>plotCI=TRUE</code> , identifies percent confidence interval to add to plot.
CIcolor1st	String. Character vector. If <code>plotCI=TRUE</code> , identifies colors to plot confidence interval lines. Must be same length as <code>CI1st</code> and from <code>colors()</code> list.
addshade	Logical. If <code>TRUE</code> , adds a light grey shading between the large confidence interval lines.
device.type	String. Type(s) of device for plotting (" <code>dev.new</code> ", " <code>jpg</code> ", " <code>pdf</code> ").
jpeg.res	Integer. Resolution for jpeg image.
device.height	Integer. Height (in inches) of barplot, if writing to file.
device.width	Integer. Width (in inches) of barplot, if writing to file.
ylim	Number. A vector of min and max values, <code>c(min,max)</code> for the y axis (or x axis if <code>horiz=TRUE</code> ). If <code>NULL</code> , defaults to maximum y value. If <code>errbars=TRUE</code> , the <code>ylim</code> defaults to the maximum y value plus the standard error.

divideby	String. Conversion number for output ('hundred', 'thousand', 'million').
ylabel	String. Label for the y axis (same as ylab).
xlabel	String. Label for the x axis (same as xlab).
xticks	Numeric vector. Vector of tick marks for x axis.
mar	See par.. A numerical vector representing number of lines for margins (c(bottom, left, top, right)).
addlegend	Logical. If TRUE, adds legend to bar plot (only applicable if grouping).
main	String. Title for plot.
cex.main	Number. Expansion factor for title.
cex.label	Number. A number representing cex in barplot (size expansion of x and/or y-labels).
cex.names	Number. Expansion factor for axis names (bar labels) (e.g., 0.5 represents half the size).
las.xnames	Number. The direction of x variable names (0,1,3). 0:diagonal (Default), 1:horizontal; 3:vertical.
las.ynames	Number. The direction of y variable names (0,1,3). 0:diagonal (Default), 1:horizontal; 3:vertical.
savedata	Logical. If TRUE, writes output data to outfolder (jpg and pdf).
outfolder	String. The name of the output folder. If savedata=TRUE, all output saved to the outfolder. If savedata=FALSE, only a text file of input parameters is saved.
outfn	String. The name of the output file if savedata=TRUE (*.csv). Do not include extension. If NULL, the file will be named BARPLOT_'yvar_date'.csv
outfn.pre	String. Add a prefix to output name (e.g., "01").
outfn.date	Logical. If TRUE, add date to end of outfile (e.g., outfn_'date'.csv).
overwrite	Logical. If TRUE and exportshp=TRUE, overwrite files in outfolder.
...	additional arguments to pass to barplot(), including a list of arguments for legend() arguments (e.g., args.legend=list(x="topleft", "bty="n"), for moving legend to topleft and removing box around legend).

### Details

If parameters = NULL, then it will prompt user for input.

### Value

Outputs barplot to display window.

### Note

If savedata = TRUE, writes a jpg and pdf of barplot to outfolder.

To add legend parameters, add a parameter named args.legend, defined as a list of specific legend parameters (see ?legend)... ex. ..., args.legend=list(x="topright"). If specifying x and y, x defines the lower right corner of legend box and y defines the upper right corner of box.

**Author(s)**

Tracey S. Frescino

**Examples**

```
# Lineplot of cubic foot volume by above-ground biomass, Wyoming tree data
# datLineplot(x = WYtree, xvar = "VOLCFNET", yvar = "DRYBIO_AG") # needs work
```

datLUTclass

*Data - Create a variable with classified values.***Description**

Merge a look-up table to define categories of continuous data in x (e.g., DIA). Adds a variable (LUTclassnm) to x, defining as: xvar >= MIN (and xvar <= MAX).

**Usage**

```
datLUTclass(
  x,
  xvar = NULL,
  LUT = NULL,
  minvar = NULL,
  maxvar = NULL,
  cutbreaks = NULL,
  cutlabels = NULL,
  LUTclassnm = NULL,
  label.dec = 1,
  NAt0 = FALSE,
  vars2keep = NULL,
  keepcutbreaks = FALSE,
  savedata = FALSE,
  savedata_opts = NULL,
  gui = FALSE
)
```

**Arguments**

x	Data frame or comma-delimited file (*.csv). The data table with variable to classify.
xvar	String. Name of variable in the data table to join to.
LUT	Data frame or comma-delimited file (*.csv). Name of the look-up table with collapsed classes. Lookup table should include minimum values for classes, maximum values for classes, and a name of class (i.e., LUTclassnm). Maximum values and names are optional.

minvar	String. If LUT is not null, name of variable with minimum class value ( $\geq$ minvar).
maxvar	String. Optional. If LUT is not null, name of variable with maximum class value ( $\leq$ maxvar).
cutbreaks	Numeric vector. Vector of numbers for minimum class values.
cutlabels	String vector. Optional. Vector of names for classes. If NULL, class names are generated from cutbreaks.
LUTclassnm	String. Optional. Name of classified variable in x. If LUT is not null and class names are included, this is the name of variable with class names. If NULL, a class names are generated from minvar or minvar and maxvar with default name equal to 'xvar'CL.
label.dec	Integer. Number of decimals to include in label.
NAto0	Logical. If TRUE, converts NA values to 0 before classification.
vars2keep	String vector. Variable names from LUT to keep (append) to x.
keepcutbreaks	Logical. If TRUE, the cutbreaks used for creating classes are appended to dataset.
savedata	Logical. If TRUE, saves data to outfolder.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE. If out_layer = NULL, default = 'datlutcl'.
gui	Logical. If gui, user is prompted for parameters.

### Details

Use datLUTclass() to prompt for input.

### Value

xLUT	Input data table with look-up table variable(s).
LUTclassnm	Name of the classified variable.
LUT	Look-up table with categories.

If savedata = TRUE, a comma-delimited file is output to the outfolder as outfn. If outfn = NULL, the name of the file will be datlut\_'date'.csv.

### Note

The look-up table format must be similar to the following table Set LUTclassnm = VARCLNM. MAX and VALCLNM columns are optional.

MIN	MAX	VARCLNM
1.0	4.9	1
5.0	9.9	2
10.0	15.0	3
15.0	19.9	4
20.0	24.9	5
25.0	49.9	6

**Author(s)**

```

head(FIESTA::ref_diacl2in)
WYtreelut <- datLUTclass(FIESTA::WYtree,
                        xvar = "DIA",
                        LUT = FIESTA::ref_diacl2in,
                        LUTclassnm = "DIACL2IN")

names(WYtreelut)
head(WYtreelut$xLUT)
table(WYtreelut$xLUT$DIACL2IN)

WYtreelut2 <- datLUTclass(FIESTA::WYtree,
                         xvar = "DIA",
                         cutbreaks = c(1, 5, 25, 50, 100),
                         LUTclassnm = "DIACL2IN")

names(WYtreelut2)
head(WYtreelut2$xLUT)
table(WYtreelut2$xLUT$DIACL2IN)

#' Create look-up table of stand age classes
MIN <- c(0, 20, 40, 60, 80, 101)
STDAGENM <- c("0-20", "21-40", "41-60", "61-80", "81-100", "101+")
stdagelut <- data.frame(MIN = MIN, STDAGENM = STDAGENM)
stdagelut

WYconclut <- datLUTclass(FIESTA::WYcond,
                        xvar = "STDAGE",
                        LUT = stdagelut,
                        LUTclassnm = "STDAGENM")

names(WYconclut)
head(WYconclut$xLUT)
table(WYconclut$xLUT$STDAGENM)

```

datLUTnm

*Data - Gets variable description or class.***Description**

Merge a look-up table to append new variables, names, or categories to x.

**Usage**

```

datLUTnm(
  x,
  xvar = NULL,
  LUT = NULL,

```

```

LUTvar = NULL,
LUTnewvar = NULL,
LUTnewvarnm = NULL,
FIAname = FALSE,
NAclass = "Other",
group = FALSE,
add0 = FALSE,
stopifmiss = FALSE,
xtxt = NULL,
savedata = FALSE,
savedata_opts = NULL,
gui = FALSE
)

```

### Arguments

x	Data frame or comma-delimited file (*.csv). The data table with variable to classify.
xvar	String. Name of variable in the data table to join to.
LUT	Data frame or comma-delimited file (*.csv). Name of the file with collapsed classes (If FIAname=FALSE).
LUTvar	String. Name of variable in LUT with values matching that xvar. If LUTvar=NULL, LUTvar=xvar.
LUTnewvar	String. Name(s) of other variable(s) in the look-up table to include in join. If NULL, all other variables in table will be included.
LUTnewvarnm	String. Different name(s) for LUTnewvar. If NULL, names will default to LUTnewvar. The length of LUTnewvarnm must equal the length for LUTnewvar.
FIAname	Logical. If TRUE, get FIA reference name based on (ref_codes) within FIESTA.
NAclass	String. NA values in xvar will be changed to NAclass.
group	Logical. If TRUE, the group variables in reference table (ref_codes) are merged to data table (GROUPCD, GROUPNM).
add0	Logical. IF TRUE, keep all codes in look up table. If FALSE, only include codes that are in x.
stopifmiss	Logical. IF TRUE, stops function if missing codes in LUTx.
xtxt	String.* Name of x table for more useful information in warnings.
savedata	Logical. If TRUE, saves data to outfolder.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE. If out_layer = NULL, default = 'datlut'.
gui	Logical. If gui, user is prompted for parameters.

### Value

xLUT	The input data table with look-up table variable(s).
xLUTnm	Name of the new variable(s).

LUT                    Look up table with categories.

If savedata = TRUE, a comma-delimited file is output to the outfolder as outfn. If outfn = NULL, the name of the file will be datlut\_'date'.csv.

### Note

For available reference tables: sort(unique(ref\_codes\$VARIABLE))

### Author(s)

Tracey S. Frescino

### Examples

```
# Append forest type names using the reference table above.
ref_fortypcd <- ref_codes[ref_codes$VARIABLE == "FORTYPCD",]
WYcondlut <- datLUTnm(WYcond,
                     xvar = "FORTYPCD",
                     LUT = ref_fortypcd,
                     LUTvar = "VALUE",
                     LUTnewvar = "MEANING",
                     LUTnewvarnm = "FORTYPNM")

names(WYcondlut)
WYcond2 <- WYcondlut$xLUT
head(WYcond2[WYcond2$FORTYPCD > 0, ])

# Append forest type names the FIAname parameter. If the xvar is in the stored
# reference table, the name and values will automatically be appended.
WYcondlut2 <- datLUTnm(WYcond,
                      xvar = "FORTYPCD",
                      FIAname = TRUE)

names(WYcondlut2)
WYcond3 <- WYcondlut2$xLUT
head(WYcond3[WYcond3$FORTYPCD > 0, ])
```

---

datPBplotchg

*Data - Generates barplot of photo-based change estimates.*

---

### Description

Generate a bar plot of net change for photo-based estimates of land use / land cover change.

### Usage

```
datPBplotchg(gainloss, CI = 95, figTitle = "")
```

**Arguments**

gainloss	Data frame or comma-delimited file (*.csv) - table with gain loss estimates.
CI	Number. Confidence Interval to include on plot.
figTitle	String. Title of figure.

**Value**

Outputs barplot to display window.

**Note**

If savedata = TRUE, writes a jpg and pdf of barplot to outfolder.

**Author(s)**

Tracey S. Frescino

---

datPBpnt2pct	<i>Data - Transpose point data to plot-level percent by domain.</i>
--------------	---

---

**Description**

Calculates percent point by plot and domain and transpose to plot level.

**Usage**

```
datPBpnt2pct(pnt, uniqueid, tvar, othervars = NULL)
```

**Arguments**

pnt	DF/DT or comma-delimited file (*.csv). Point-level table with one record per point. If NULL, aggregated point counts must be in pntcnt.
uniqueid	String. Name of unique identifier of plot in pnt.
tvar	String. Name of variable to transpose.
othervars	String vector. Name(s) of plot-level variables to merge with transposed data.

**Value**

pltdom.pct Data frame with transposed data.

**Author(s)**

Tracey S. Frescino

**Examples**

```
# Load necessary data from FIESTA
## Point data
icepntfn <- system.file("extdata",
                        "PB_data/icepnt_utco1135.csv",
                        package = "FIESTA")
icepnt <- read.csv(icepntfn)

# Convert to percent
percent <- datPBpnt2pct(pnt = icepnt,
                       uniqueid = "plot_id",
                       tvar = "cover_1")

head(percent)
```

---

datPivot

*Data - Generates a pivot table.*

---

**Description**

Generates a pivot table of values by x row and y column.

**Usage**

```
datPivot(
  x,
  pvar,
  xvar,
  yvar,
  pfun = sum,
  xfilter = NULL,
  NAto0 = TRUE,
  dropNAxvar = TRUE,
  dropNAyvar = TRUE,
  pvar.round = 2,
  savedata = FALSE,
  savedata_opts = NULL,
  gui = FALSE
)
```

**Arguments**

x	Dataframe. Table with pivot variables.
pvar	String. The name of the variable for pivot table values.
xvar	String. The name of the variable for rows.
yvar	String. The name of the variable for columns.
pfun	Function. The name of the function to use for pivot table values (ex. sum, mean, max).

xfilter	String. A filter to subset the datatable table x before pivoting (ex. "STATUSCD == 1").
NAto0	Logical. If TRUE, converts NA values to 0.
dropNAxvar	Logical. If TRUE, removes columns that are NA.
dropNAyvar	Logical. If TRUE, removes rows that have NA values.
pvar.round	Integer. Number to round pvar values to.
savedata	Logical. If TRUE, writes output data to outfolder.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE. If out_layer = NULL, default = 'datpivot'.
gui	Logical. If TRUE, pop-up windows will appear for user-interface.

**Value**

ptab	Matrix. The pivot table.
------	--------------------------

**Author(s)**

Tracey S. Frescino

**Examples**

```
# Pivot WYcond table
datPivot(x = FIESTA::WYcond,
         pvar = "CONDPROP_UNADJ",
         xvar = "FORTYPCD",
         yvar = "STDSZCD")
```

```
# Pivot WYtree table
datPivot(x = FIESTA::WYtree,
         pvar = "TPA_UNADJ",
         xvar = "SPCD",
         yvar = "STATUSCD",
         pfun = mean,
         NAto0 = TRUE)
```

---

datPlotcnt

*Database - Get plot counts.*

---

**Description**

Extract plot counts by inventory year and state.

**Usage**

```
datPlotcnt(
  plt,
  yrtype = "INVYR",
  states = NULL,
  designcd = FALSE,
  forsamp = TRUE,
  total = TRUE,
  subtotal = TRUE,
  savedata = FALSE,
  outfolder = NULL,
  outfn = NULL,
  gui = FALSE
)
```

**Arguments**

<code>plt</code>	Data frame. Table of plot-level variables to count plots. If using this table, it must include INVYR.
<code>yrtype</code>	String. Type of year to categorize data ("INVYR", "MEASYEAR").
<code>states</code>	String vector. The states in <code>plt</code> table.
<code>designcd</code>	Logical. If TRUE, includes FIA design codes in the table.
<code>forsamp</code>	Logical. If TRUE, includes forest/nonforest/nonsampled codes in the table.
<code>total</code>	Logical. If TRUE, a row is added to bottom of table with a total for the whole table.
<code>subtotal</code>	Logical. If TRUE, a row is added to bottom of each section for subtotals.
<code>savedata</code>	Logical. If TRUE, saves data to outfolder as comma-delimited file (*.csv). No objects are returned. If FALSE, the data are saved as R objects and returned to user. See details for caveats.
<code>outfolder</code>	String. The output folder path. If NULL and savedata=TRUE or parameters=TRUE, outfolder is the working directory.
<code>outfn</code>	String. The name of the output file. If NULL, defaults to <code>pltcnt_'date'.csv</code>
<code>gui</code>	Logical. If TRUE, gui windows pop up for parameter selection.

**Value**

`pltcnt` - a dataframe of counts (YEAR, STABBR, STCD, PLOTS, NONSAMPLED, FOREST, NONFOREST)

**Author(s)**

Tracey S. Frescino

datSumCond

*Data - Aggregates numeric condition data to plot level.***Description**

Aggregates CONDPROP\_UNADJ variable or other continuous condition variables to plot level with option to apply condition filters. If condition variable is not CONDPROP\_UNADJ the variable is multiplied by CONDPROP\_UNADJ for weighted sum.

**Usage**

```
datSumCond(
  cond = NULL,
  datasource = "obj",
  data_dsn = NULL,
  plt = NULL,
  plt_dsn = NULL,
  cuniqueid = "PLT_CN",
  puniqueid = "CN",
  csumvar = NULL,
  csumvarnm = NULL,
  cfilter = NULL,
  getadjplot = FALSE,
  adjcond = FALSE,
  NAt00 = FALSE,
  returnDT = TRUE,
  savedata = FALSE,
  savedata_opts = NULL,
  gui = FALSE
)
```

**Arguments**

cond	Data frame or comma-delimited file (*.csv). Condition-level table with aggregate variable and CONDPROP_UNADJ.
datasource	String. Source of data ('obj', 'csv', 'sqlite', 'gdb').
data_dsn	String. If datasource='sqlite', the name of SQLite database (*.sqlite).
plt	Data frame, comma-delimited file (*.csv), shapefile (*.shp), or database file. Plot-level table to join the aggregated tree data to (if bycond=FALSE). Nonsampled plots (PLOT_STATUS_CD = 3) are removed. Optional.
plt_dsn	String. The data source name (dsn; i.e., folder or database name) of plt. The dsn varies by driver. See gdal OGR vector formats ( <a href="https://www.gdal.org/ogr_formats.html">https://www.gdal.org/ogr_formats.html</a> ). Optional.
cuniqueid	String. Unique identifier of cond (default = "PLT_CN").
puniqueid	String. Unique identifier of plt (default = "CN").

csumvar	String. One or more variable names to sum to plot level.
csumvarnm	String. Name of the resulting aggregated plot-level variable(s). Default = csumvar + '_PLT'.
cfilter	String. A filter to subset the cond data before aggregating (e.g., "COND_STATUS_CD == 1"). Must be R syntax.
getadjplot	Logical. If TRUE, adjustments are calculated for nonsampled conditions on plot.
adjcond	Logical. If TRUE, csumvar condition variables are adjusted for nonsampled conditions by plot.
NAt0	Logical. If TRUE, convert NA values to 0.
returnDT	Logical. If TRUE, returns data.table object(s). If FALSE, returns data.frame object(s).
savedata	Logical. If TRUE, saves data to outfolder.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE. If out_layer = NULL, default = 'condsum'.
gui	Logical. If gui, user is prompted for parameters.

### Details

If variable = NULL, then it will prompt user for input.

### Value

A list of the following items:

condsum	Data frame. Plot-level table with aggregated condition attribute.
cfilter	Condition filter.

If savedata=TRUE, condsum is saved to the outfolder.

### Note

Nonsampled plots are removed from table.

### Author(s)

Tracey S. Frescino

### Examples

```
# Aggregate LIVE_CANOPY_CVR_PCT to plot, weighted by CONDPROP_UNADJ
condsum <- datSumCond(cond = FIESTA::WYcond,
                      csumvar = "LIVE_CANOPY_CVR_PCT")$condsum

# Check results
condsum[condsum$PLT_CN == 40404737010690,]
FIESTA::WYcond[FIESTA::WYcond$PLT_CN == 40404737010690,]
```

---

`datSumTree`*Data - Aggregates numeric tree data to the plot or condition-level.*

---

**Description**

Aggregates numeric tree-level data (e.g., VOLCFNET) to plot or condition, including options for filtering tree data or extrapolating to plot acre by multiplying by TPA.

**Usage**

```
datSumTree(  
  tree = NULL,  
  seed = NULL,  
  cond = NULL,  
  datsource = "obj",  
  data_dsn = NULL,  
  plt = NULL,  
  plt_dsn = NULL,  
  tuniqueid = "PLT_CN",  
  cuniqueid = "PLT_CN",  
  puniqueid = "CN",  
  bycond = FALSE,  
  condid = "CONDID",  
  bysubp = FALSE,  
  subpid = "SUBP",  
  tsumvarlst = NULL,  
  tsumvarnmlst = NULL,  
  TPA = TRUE,  
  tfun = sum,  
  ACI = FALSE,  
  tfilter = NULL,  
  addseed = FALSE,  
  lbs2tons = TRUE,  
  metric = FALSE,  
  getadjplot = FALSE,  
  adjtree = FALSE,  
  adjvar = "tadjfac",  
  adjTPA = 1,  
  NAt0 = FALSE,  
  tround = 5,  
  checkNA = FALSE,  
  returnDT = TRUE,  
  savedata = FALSE,  
  savedata_opts = NULL,  
  gui = FALSE  
)
```

**Arguments**

tree	Dataframe or comma-delimited file (*.csv). The tree-level table.
seed	Dataframe or comma-delimited file (*.csv). The seedling table.
cond	Dataframe or comma-delimited file (*.csv). Condition-level table to join the aggregated tree data to, if bycond=TRUE. This table also may be used for condition proportion or strata variables used if adjcond or adjstrata = TRUE (See details below). This table is optional.
datsource	String. Source of data ('obj', 'csv', 'sqlite', 'gdb').
data_dsn	String. If datsource='sqlite', the name of SQLite database (*.sqlite).
plt	Dataframe, comma-delimited file (*.csv), or shapefile (*.shp). Plot-level table to join the aggregated tree data to, if bycond=FALSE. This table is optional.
plt_dsn	String. The data source name (dsn; i.e., folder or database name) of plt. The dsn varies by driver. See gdal OGR vector formats ( <a href="https://www.gdal.org/ogr_formats.html">https://www.gdal.org/ogr_formats.html</a> ). Optional.
tuniqueid	String. Unique identifier of plt in tree table.
cuniqueid	String. Unique identifier of plt in cond table if cond is NOT NULL.
puniqueid	String. Unique identifier of plt table if plt is NOT NULL.
bycond	Logical. If TRUE, the data are aggregated to the condition level (by: cuniqueid, condid). If FALSE, the data are aggregated to the plot level (by: puniqueid).
condid	String. Unique identifier for conditions.
bysubp	Logical. If TRUE, data are aggregated to the subplot level.
subpid	String. Unique identifier of each subplot.
tsumvarlst	String (vector). Tree-level variable(s) to aggregate (e.g., "TPA_UNADJ", "BA"). Use tsumvar="PLT_CN" (tfun=sum) for summed tree count.
tsumvarnmlst	String (vector). Name of the tree-level variable(s) to aggregate (e.g., "TPALIVE", "BALIVE"). This list must have the same number of variables as tsumvarlst and be in respective order. If NULL, the default names will be tsumvar'_tfun' (e.g., "TPA_UNADJ_SUM", "BA_SUM").
TPA	Logical. If TRUE, tsumvarlst variable(s) are multiplied by the respective trees-per-acre variable (see details) to get per-acre measurements.
tfun	Function. The name of the function to use to aggregate the data (e.g., sum, mean, max).
ACI	Logical. If TRUE, if ACI (All Condition Inventory) plots exist, any trees on these plots will be included in summary. If FALSE, you must include condition table.
tfilter	String. Filter to subset the tree data before aggregating (e.g., "STATUSCD == 1"). This must be in R syntax. If tfilter=NULL, user is prompted. Use tfilter="NONE" if no filters.
addseed	Logical. If TRUE, add seedling data to tree counts (if TPA variable in tsumvarlst).
lbs2tons	Logical. If TRUE, converts biomass or carbon variables from pounds to tons. If metric=TRUE, converts to metric tons, else short tons.

metric	Logical. If TRUE, converts response to metric units based on FIESTA::ref_conversion, if any variable in tsumvarlst is in FIESTAutils::ref_estvar. Note: if TPA, TPA is converted to trees per hectare (TPH: $1 / (1/ \text{tpavar} * 0.4046860)$ ).
getadjplot	Logical. If TRUE, adjustments are calculated for nonsampled conditions on plot.
adjtree	Logical. If TRUE, trees are individually adjusted by adjustment factors. Adjustment factors must be included in tree table (see adjvar).
adjvar	String. If adjtree=TRUE, the name of the variable to use for multiplying by adjustment (e.g., tadjfac).
adjTPA	Numeric. A tree-per-acre adjustment. Use for DESIGNCD=1 (annual inventory), if using less than 4 subplots. If using only 1 subplot for estimate, adjTPA=4. The default is 1.
NAto0	Logical. If TRUE, convert NA values to 0.
tround	Number. The number of digits to round to. If NULL, default=6.
checkNA	Logical. If TRUE, checks if NA values exist in necessary variables.
returnDT	Logical. If TRUE, returns data.table object(s). If FALSE, returns data.frame object(s).
savedata	Logical. If TRUE, saves data to outfolder.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE. If out_layer = NULL, default = 'treesum'.
gui	Logical. If gui, user is prompted for parameters.

## Details

If variable = NULL, then it will prompt user for input.

Dependent external functions: datFilter Dependent internal functions: addcommas, fileexistsnm, getadjfactor

For adjcond (bycond=FALSE):

If you want to get trees-per-acre information aggregated to plot or condition level, you need to include a TPA variable in tree table.

For tsumvars = GROWCFGS, GROWBFSL, GROWCFAL, FGROWCFGS, FGROWBFSL, or FGROWCFAL, you must have TPAGROW\_UNADJ

For tsumvars = MORTCFGS, MORTBFSL, MORTCFAL, FMORTCFGS, FMORTBFSL, or FMORTCFAL, you must have TPAMORT\_UNADJ

For tsumvars = REMVCFGS, REMVBFSL, REMVCFAL, FREMVCFGS, FREMVBFSL, or FREMVCFAL, you must have TPAREMV\_UNADJ

If you want to adjust plot-level information by condition proportions (adjplot), you need to include CONDID & CONDPROP\_UNADJ in cond or tree table and COND\_STATUS\_CD and FORTYPCD if adjplot="FVS". For adjplot="WEIGHTED" - each tree is weighted (or multiplied) by the condition proportions (CONDPROP\_UNADJ). For adjplot="FVS", each tree is weighted (or multiplied) by the sum of the condition proportions (CONDPROP\_UNADJ) that are forested and not non-stocked (COND\_STATUS\_CD = 1 and FORTYPCD != 999).

**Value**

A list of the following items:

treedat            Data frame. Plot or condition-level table with aggregated tree attributes.  
sumvars           String vector. Name(s) of the output aggregated tree attributes.

If savedata=TRUE

- treedat will be saved to the outfolder.

- a text file of input parameters is saved to outfolder ('outfn'\_parameters\_'date'.txt).

**Note**

If a dat table is provided, the aggregated tree data will be merged to table and NULL values will be output as 0.

**Author(s)**

Tracey S. Frescino

**Examples**

```
# Aggregate LIVE_CANOPY_CVR_PCT to plot, weighted by CONDPROP_UNADJ
treesum <- datSumTree(tree = FIESTA::WYtree,
                      tsumvar1st = "TPA_UNADJ")$treedat

# Check results
treesum[treesum$PLT_CN == 40404737010690,]
FIESTA::WYtree[FIESTA::WYtree$PLT_CN == 40404737010690,]
```

---

datSumTreeDom	<i>Data - Aggregates numeric tree data by tree domain (i.e. species) to plot or condition-level.</i>
---------------	--

---

**Description**

Aggregates numeric tree domain data (e.g., SPCD) to plot or condition, including options for filtering tree data or extrapolating to plot acre by multiplying by TPA. Includes options for generating barplots, proportion data, and cover data.

**Usage**

```
datSumTreeDom(
  tree = NULL,
  seed = NULL,
  cond = NULL,
  datsource = "obj",
  data_dsn = NULL,
  plt = NULL,
```

cond	Data frame or comma-delimited file (*.csv). Condition-level table to join the aggregated tree data to, if bycond=TRUE. This table also may be used for condition proportion or strata variables used if adjcond or adjstrata = TRUE (See details below). This table is optional. If included, CONDID must be present in table.
datsource	String. Source of data ('obj', 'csv', 'sqlite', 'gdb').
data_dsn	String. If datsource='sqlite', the name of SQLite database (*.sqlite).
plt	Data frame, comma-delimited file (*.csv), shapefile (*.shp), or database file. Plot-level table to join the aggregated tree data to (if bycond=FALSE). Nonsampled plots (PLOT_STATUS_CD = 3) are removed. Optional.
plt_dsn	String. The data source name (dsn; i.e., folder or database name) of plt. The dsn varies by driver. See gdal OGR vector formats ( <a href="https://www.gdal.org/ogr_formats.html">https://www.gdal.org/ogr_formats.html</a> ). Optional.
tuniqueid	String. Unique identifier of the tree table. If including seedling table, this should be the same for seed.
cuniqueid	String. Unique identifier of the cond table if cond is NOT NULL.
puniqueid	String. Unique identifier of the plt table if plt is NOT NULL.
bycond	Logical. If TRUE, data are aggregated to the condition level (by: uniqueid, CONDID). If FALSE, data are aggregated to the plot level (by: uniqueid).
condid	String. Unique identifier for conditions.
bysubp	Logical. If TRUE, data are aggregated to the subplot level.
subpid	String. Unique identifier of each subplot.
tsumvar	String. Name of the variable to aggregate (e.g., "BA"). For summing number of trees, use tsumvar="PLT_CN" with tfun=sum.
TPA	Logical. If TRUE, tsumvarlst variable(s) are multiplied by the respective trees-per-acre variable (see details) to get per-acre measurements.
tfun	Function. Name of the function to use to aggregate the data (e.g., sum, mean, max).
ACI	Logical. If TRUE, if ACI (All Condition Inventory) plots exist, any trees on these plots will be included in summary. If FALSE, you must include condition table.
tfilter	String. A filter to subset the tree data before aggregating (e.g., "STATUSCD == 1"). This must be in R syntax. If tfilter=NULL, user is prompted. Use tfilter="NONE" if no filters.
lbs2tons	Logical. If TRUE, converts biomass or carbon variables from pounds to tons. If metric=TRUE, converts to metric tons, else short tons.
metric	Logical. If TRUE, converts response to metric units based on FIESTA::ref_conversion, if tsumvar is in FIESTAutils::ref_estvar. Note: if TPA, TPA is converted to trees per hectare (TPH: $1 / (1/tpavar * 0.4046860)$ ).
tdomvar	String. The tree domain (tdom) variable used to aggregate by (e.g., "SPCD", "SPGRPCD").
tdomvarlst	String (vector). List of specific tree domains of tdomvar to aggregate (ex. c(108, 202)). If NULL, all domains of tdomvar are used.

tdomvar2	String. A second tree domain variable to use to aggregate by (ex. "DIACL"). The variables, tdomvar and tdomvar2 will be concatenated before summed.
tdomvar2lst	String (vector). List of specific tree domains of tdomvar2 to aggregate. If NULL, all domains of tdomvar2 are used.
tdomprefix	String. The prefix used for naming the aggregated tree data, before numeric codes (e.g., "SP" = SP102, SP746).
tdombarplot	Logical. If TRUE and pivot=TRUE, calls datBarplot() and outputs a barplot of tdom distributions. If savedata=TRUE, barplots are written to outfolder.
tdomt	Logical. If TRUE and pivot=TRUE a total of all tree domains in tdomvarlst is calculated and added to output data frame.
tdomttnm	String. If tdomtot=TRUE, the variable name for the total column in output data frame. If NULL, the default will be tdomvar + 'TOT'.
FIAname	Logical. If TRUE, changes names of columns for SPCD and SPGRPCD from code to FIA names.
addseed	Logical. If TRUE, add seedling counts to tree counts. Note: tdomvar must be 'SPCD' or 'SPGRPCD'.
pivot	Logical. If TRUE, tdomvar data are transposed (pivoted) to separate columns.
presence	Logical. If TRUE, an additional table is output with tree domain values as presence/absence (1/0).
proportion	Logical. If TRUE and pivot=TRUE, an additional table will be output with tree domain data as proportions of total tsumvar.
cover	Logical. If TRUE and pivot=TRUE, , an additional table will be output with tree domain data as percent cover, based on proportions of tsumvar (see proportion) and tree canopy cover variable in cond (LIVE_CANOPY_CVR_PCT) or in plt (CCLIVEPLT). Does not include seedlings.
getadjplot	Logical. If TRUE, adjustments are calculated for nonsampled conditions on plot.
adjtree	Logical. If TRUE, trees are individually adjusted by adjustment factors. Adjustment factors must be included in tree table (see adjvar).
adjvar	String. If adjtree=TRUE, the name of the variable to use for multiplying by adjustment (e.g., tadjfac).
NAto0	Logical. If TRUE, convert NA values to 0.
adjTPA	Numeric. A tree-per-acre adjustment. Use for DESIGNCD=1 (annual inventory), if using less than 4 subplots. If using only 1 subplot for estimate, adjTPA=4. The default is 1.
tround	Number. The number of digits to round to. If NULL, default=6.
checkNA	Logical. If TRUE, checks if NA values exist in necessary variables.
returnDT	Logical. If TRUE, returns data.table object(s). If FALSE, returns data.frame object(s).
savedata	Logical. If TRUE, saves data to outfolder.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE. If out_layer = NULL, default = 'tdomsum'.
gui	Logical. If gui, user is prompted for parameters.

## Details

If variable = NULL, then it will prompt user for input.

If you want to get trees-per-acre information aggregated to plot or condition level, you need to include a TPA variable in tree table.

For tsumvars = GROWCFGs, GROWBFSL, GROWCFAL, FGROWCFGs, FGROWBFSL, or FGROWCFAL, you must have TPAGROW\_UNADJ

For tsumvars = MORTCFGs, MORTBFSL, MORTCFAL, FMORTCFGs, FMORTBFSL, or FMORTCFAL, you must have TPAMORT\_UNADJ

For tsumvars = REMVCFGs, REMVBFSL, REMVCFAL, FREMVCFGs, FREMVBFSL, or FREMVCFAL, you must have TPAREMV\_UNADJ

If you want to adjust plot-level information by condition proportions, you need to include CONdid & CONdPROP\_UNADJ in cond or tree table.

If you want to adjust the aggregated tree data by the area of the strata (estimation unit), you need to either have a variable in your tree data named adjfact or you need to included the following variables in your datasets:

Condition table: STATECD, CONdid, STRATA, ESTUNIT, SUBPPROP\_UNADJ, MICRPROP\_UNADJ (if microplot trees) MACRPROP\_UNADJ (if macroplot trees).

Tree table: TPA\_UNADJ

All trees where DIA=NA are removed from analysis. These are trees that were remeasured but are no longer in inventory (ex. a tree that is dead and not standing in the current inventory).

## Value

tdomdata - a list of the following objects:

tdomdat	Data frame. Plot or condition-level table with aggregated tree domain (tdom) attributes (filtered).
tdomsum	Data frame. The tdom look-up table with data aggregated by species.
tdomvar	String. Name of the tdom variable used to aggregate by.
tsumvar	String. Name of the aggregated output variable.
tdomlst	Vector. List of the aggregated tree data in tdomdat.
tdomdat.pres	Data frame. Plot or condition-level table with aggregated tree domain attributes represented as presence/absence (1/0).
tdomdat.prop	Data frame. Plot or condition-level table with aggregated tree domain attributes represented as proportion of total by plot.
tdomdat.cov	Data frame. Plot or condition-level table with aggregated tree domain attributes represented as percent cover, multiplying cover attribute by tdom proportion by plot.

If savedata=TRUE

- tdomdat will be saved to the outfolder ('tdomprefix'\_DAT.csv).

- a text file of input parameters is saved to outfolder ('outfn'\_parameters\_'date'.txt).

- if presence=TRUE, tdomdat.pres is saved to outfolder ('tdomprefix'\_PRESDAT.csv) - if proportion=TRUE, tdomdat.prop is saved to outfolder ('tdomprefix'\_PROPDAT.csv) - if cover=TRUE, tdomdat.cov is saved to outfolder ('tdomprefix'\_COVDAT.csv)

**Note**

This function can be used to get tree domain data. This data can be used for mapping tree domain distributions.

**Author(s)**

Tracey S. Frescino

**Examples**

```
# Sum of Live Basal Area Per Acre by Species
datSumTreeDom(tree = FIESTA::WYtree,
  cond = FIESTA::WYcond,
  plt = FIESTA::WYplt,
  puniqueid = "CN",
  bycond = FALSE,
  tsumvar = "BA",
  TPA = TRUE,
  tdomtot = TRUE,
  tdomtotnm = "BA_LIVE",
  tdomprefix = "BA_LIVE",
  tround = 2,
  tfilter = "STATUSCD==1")

# Sum of Number of Live Trees by Species
datSumTreeDom(tree = FIESTA::WYtree,
  cond = FIESTA::WYcond,
  plt = FIESTA::WYplt,
  puniqueid = "CN",
  bycond = FALSE,
  tsumvar = "PLT_CN",
  TPA = TRUE,
  tdomtot = TRUE,
  tdomprefix = "CNT",
  tround = 0,
  tfilter = "STATUSCD==1")

# Sum of Number of Live Trees by Species, Including Seedlings
datSumTreeDom(cond = WYcond,
  plt = WYplt,
  seed = WYseed,
  puniqueid = "CN",
  bycond = FALSE,
  tsumvar = "PLT_CN",
  TPA = TRUE,
  tdomtot = TRUE,
  tdomprefix = "CNT",
  tround = 0)
```

---

 DBgetCSV

*Database - Extracts data table(s) from FIA DataMart.*

---

### Description

Downloads and extracts compressed comma-delimited file(s) (\*.zip) from FIA DataMart (<https://apps.fs.usda.gov/fia/datamar>). Only 1 table can be specified, but multiple states may be included.

### Usage

```
DBgetCSV(
  DBtable,
  states = NULL,
  returnDT = FALSE,
  stopifnull = TRUE,
  noIDate = TRUE
)
```

### Arguments

DBtable	String. Name of table to download. Only 1 table allowed.
states	String or numeric vector. Name (e.g., "Arizona", "New Mexico") or code (e.g., 4, 35) of states to download data. If NULL, tables that are not state-level are downloaded.
returnDT	Logical. If TRUE, a data table is returned, else, a data frame.
stopifnull	Logical. If TRUE, stop if table is NULL.
noIDate	Logical. If TRUE, do not include columns with type IDate.

### Details

The compressed data files are downloaded from FIA DataMart; saved to a temporary space; extracted and imported; and deleted from temporary space. Accessibility and download time depends on access and speed of internet connection.

### Value

Returns a data table (returnDT=TRUE), or data.frame (returnDT=FALSE) of downloaded table(s). If more than one state, returned as one table.

### Author(s)

Tracey S. Frescino

**Examples**

```
## Not run:
# Get plot data for multiple states
FIAplots <- DBgetCSV("PLOT", c("Georgia", "Utah"))
table(FIAplots$STATECD)

## End(Not run)
```

---

DBgetValid	<i>Database - Gets or checks FIA EVALIDs and/or gets inventory years from FIA's online publicly-available DataMart (<a href="https://apps.fs.usda.gov/fia/datamart/CSV/datamart_csv.html">https://apps.fs.usda.gov/fia/datamart/CSV/datamart_csv.html</a>).</i>
------------	---

---

**Description**

Extracts FIA EVALIDs for identifying an estimation group of plots. EVALIDs may be extracted by most current evaluation (evalCur=TRUE) or by the end year of an evaluation (evalEndyr) or all evaluations in the database for one or more states. See details for more information.

**Usage**

```
DBgetValid(
  states = NULL,
  RS = NULL,
  datasource = "datamart",
  data_dsn = NULL,
  invtype = "ANNUAL",
  evalCur = TRUE,
  evalEndyr = NULL,
  evalid = NULL,
  evalAll = FALSE,
  evalType = "VOL",
  invyrtab = NULL,
  dbTabs = dbTables(),
  dbconn = NULL,
  dbconnopen = FALSE,
  gui = FALSE
)
```

**Arguments**

states	String or numeric vector. Name (e.g., 'Arizona', 'New Mexico') or code (e.g., 4, 35) of state(s) for evalid. If all states in one or more FIA Research Station is desired, set states=NULL and use RS argument to define RS.
RS	String vector. Name of research station(s) ('RMRS', 'SRS', 'NCRS', 'NERS', 'PNWRS'). Do not use if states is populated.
datasource	Source of data ('datamart', 'sqlite').

data_dsn	If datasource='sqlite', the file name (data source name) of the sqlite database (*.sqlite).
invtype	String. The type of FIA data to extract ('PERIODIC', 'ANNUAL'). See further details below.
evalCur	Logical. If TRUE, the most current evaluation is extracted for state(s).
evalEndyr	Number. The end year of the evaluation period of interest. Selects only sampled plots and conditions for the evaluation period. If more than one state, create a named list object with evalEndyr labeled for each state (e.g., list(Utah=2014, Colorado=2013)).
evalid	Integer. One or more EVALID to check if exists.
evalAll	Logical. If TRUE, gets all EVALIDs for invtype.
evalType	String vector. The type(s) of evaluation of interest ('ALL', 'CURR', 'VOL', 'GRM', 'P2VEG', 'DWM', 'INV', 'REGEN', 'CRWN'). The evalType 'ALL' includes nonsampled plots; 'CURR' includes plots used for area estimates; 'VOL' includes plots used for area and/or tree estimates; The evalType 'GRM' includes plots used for growth, removals, mortality, and change estimates (eval_typ are accepted. See details below and FIA database manual for regional availability and/or differences.
invyrtab	Data frame. A data frame including inventory years by state. If NULL, it is generated from SURVEY table from FIA database based on states and invtype.
dbTabs	List of database tables the user would like returned. See help(dbTables) for a list of options.
dbconn	Open database connection.
dbconnopen	Logical. If TRUE, the dbconn connection is not closed.
gui	Logical. If TRUE, gui windows pop up for parameter selection.

## Details

### FIA Evaluation

An Evaluation defines a group of plots in the FIA Database used for state-level estimates, representing different spans of data and different stratification and area adjustments. An Evaluation Type (evalType) is used to identify a specific set of plots for a particular response to be able to ensure a sample-based estimate for a population. See FIA's Database documentation for current available Evaluation Types and descriptions (<https://www.fia.fs.fed.us/library/database-documentation/index.php>).

### EVALID

An EVALID is a unique code defining an Evaluation, generally in the format of a 2-digit State code, a 2-digit year code, and a 2-digit Evaluation Type code.

### EVAL\_TYP

EVALIDCD	EVAL_TYP	Description
00	EXPALL	All area
01	EXPVOL/EXPCURR	Area/Volume
03	EXPCHNG/EXPGROW/EXPMORT/EXPREMV	Area Change/GRM
07	EXPDWM	DWM

08	EXPREGEN	Regeneration
09	EXPINV	Invasive
10	EXPP2VEG	Veg profile
12	EXPCRWN	Crown

**Value**

A list of the following objects:

states	String vector. State names.
rslst	String vector. FIA research station names included in output.
evalidlist	Named list. evalid by state.
invtype	String. Inventory type for states(s) (ANNUAL/PERIODIC).
invyrtab	Data frame. Inventory years by state for evalidlist.
evalTypelist	Named list. Evaluation type(s) by state.
invyrs	Named list. Inventory years by state for evalidlist.
SURVEY	Data frame. If returnPOP=TRUE, the SURVEY table from FIADB.

**Note**

FIA database tables used:

1. SURVEY - To get latest inventory year, invyrtab = NULL
2. POP\_EVAL - To get EVALID and EVALID years

**Author(s)**

Tracey S. Frescino

**Examples**

```
## Not run:
# Get evalid and inventory years for Wyoming
WYeval <- DBgetEvalid(states="Wyoming")
names(WYeval)

WYeval$evalidlist
WYeval$invtype
WYeval$invyrtab
WYeval$evalType
WYeval$invyrs

# Get evalid for Utah and Wyoming
DBgetEvalid(states=c("Wyoming", "Utah"))

# Get evalid for an FIA Research Station
RSevalid <- DBgetEvalid(RS="NERS")
names(RSevalid)
```

```
RSevalid$evalidlist  
## End(Not run)
```

---

DBgetPlots

*Database - Extracts inventory plot data from FIA DataMart.*

---

### Description

Extracts data from FIA's online publicly-available DataMart ([https://apps.fs.usda.gov/fia/datamart/CSV/datamart\\_csv.html](https://apps.fs.usda.gov/fia/datamart/CSV/datamart_csv.html)).

### Usage

```
DBgetPlots(  
  states = NULL,  
  RS = NULL,  
  datsource = "datamart",  
  data_dsn = NULL,  
  dbTabs = dbTables(),  
  eval = "FIA",  
  eval_opts = NULL,  
  puniqueid = "CN",  
  invtype = "ANNUAL",  
  intensity1 = FALSE,  
  istree = FALSE,  
  isseed = FALSE,  
  isveg = FALSE,  
  issubp = FALSE,  
  ischng = FALSE,  
  isdwm = FALSE,  
  biojenk = FALSE,  
  greenwt = FALSE,  
  plotgeom = FALSE,  
  othertables = NULL,  
  getxy = TRUE,  
  xy_datsource = NULL,  
  xy_dsn = NULL,  
  xy = "PLOT",  
  xy_opts = xy_options(),  
  xymeasCur = FALSE,  
  coordType = "PUBLIC",  
  pjoinid = NULL,  
  issp = FALSE,  
  sponcond = FALSE,  
  sponcondid1 = FALSE,  
  defaultVars = TRUE,  
  regionVars = FALSE,
```

```

regionVarsRS = "RMRS",
ACI = FALSE,
subcycle99 = FALSE,
stateFilter = NULL,
allFilter = NULL,
alltFilter = NULL,
returndata = TRUE,
savedata = FALSE,
saveqry = FALSE,
savePOP = FALSE,
savedata_opts = NULL,
dbconn = NULL,
dbconnopen = FALSE,
evalInfo = NULL
)

```

### Arguments

states	String or numeric vector. Name (e.g., 'Arizona','New Mexico') or code (e.g., 4, 35) of state(s) for evalid. If all states in one or more FIA Research Station is desired, set states=NULL and use RS argument to define RS.
RS	String vector. Name of research station(s) to get public XY coordinates for ('RMRS','SRS','NCRS','NERS','PNWRS'). Do not use if states is populated. See FIESTA::ref_statedc for reference to RS and states.
datsource	String. Source of data ('datamart', 'sqlite').
data_dsn	String. If datsource='sqlite', the name of SQLite database (*.sqlite).
dbTabs	List of database tables the user would like returned. See help(dbTables) for a list of options.
eval	String. Type of evaluation time frame for data extraction ('FIA', 'custom'). See eval_opts for more further options.
eval_opts	List of evaluation options for 'FIA' or 'custom' evaluations to determine the set of data returned. See help(eval_options) for a list of options.
puniqueid	String. Name of unique identifier in plot_layer in dbTabs.
invtype	String. Type of FIA inventory to extract ('PERIODIC', 'ANNUAL'). Only one inventory type (PERIODIC/ANNUAL) at a time.
intensity1	Logical. If TRUE, includes only plots where INTENSITY = 1.
istree	Logical. If TRUE, tree data are extracted from TREE table in database.
isseed	Logical. If TRUE, seedling data are extracted from SEEDLING table in database.
isveg	Logical. If TRUE, understory vegetation tables are extracted from FIA database (P2VEG_SUBPLOT_SPP, P2VEG_SUBP_STRUCTURE, INVASIVE_SUBPLOT_SPP).
issubp	Logical. If TRUE, subplot tables are extracted from FIA database (SUBPLOT, SUBP_COND).
ischng	Logical. If TRUE, sccm (SUBP_COND_CHNG_MTRX) table is returned that includes current and previous conditions.

isdwm	Logical. If TRUE, summarized condition-level down woody debris data are extracted from FIA database (COND_DWM_CALC).
biojenk	Logical. If TRUE, Jenkins biomass is calculated.
greenwt	Logical. If TRUE, green weight biomass is calculated.
plotgeom	Logical. If TRUE, variables from the PLOTGEOM table are appended to the plot table.
othertables	String Vector. Name of other table(s) in FIADB to include in output. The table must have PLT_CN as unique identifier of a plot.
getxy	Logical. If TRUE, gets separate XY table.
xy_datsource	Source of XY data ('obj', 'csv', 'datamart', 'sqlite').
xy_dsn	If datsource='sqlite', the file name (data source name) of the sqlite database (*.sqlite) where XY data are.
xy	sf R object or String. Table with xy coordinates. Can be a spatial polygon object, data frame, full pathname to a shapefile, or name of a layer within a database.
xy_opts	List of xy data options to specify if xy is NOT NULL. See xy_options (e.g., xy_opts = list(xvar='LON', yvar='LAT')).
xymeasCur	Logical. If TRUE, include XY coordinates from the most current sampled measurement of each plot.
coordType	String. Type of xy coordinates using ('PUBLIC', 'ACTUAL')
pjoinid	String. Variable in plt to join to XY data. Not necessary to be unique. If using most current XY coordinates, use identifier for a plot (e.g., PLOT_ID).
issp	Logical. If TRUE, an sf spatial object is generated from the public X/Y coordinates in the plot table.
spcond	Logical. If TRUE, a set of condition-level attributes (e.g., FORTYPCD) represented at the plot-level are extracted from FIA DataMart COND table. (See Notes for more info on how condition attributes were added).
spcondid1	Logical. If TRUE and issp=TRUE and spcond=TRUE, condition variables are determined by condition 1 attributes. If FALSE, an algorithm is used to select the condition to use (See details for algorithm used).
defaultVars	Logical. If TRUE, a set of default variables are selected in query. See notes for variable descriptions.
regionVars	Logical. If TRUE, regional variables are included in query (e.g., SDI_RMRS, SDIPCT_RMRS, SDIMAX_RMRS, QMD_RMRS).
regionVarsRS	String. Region for regionVars ('RMRS', 'SRS', 'NCRS', 'NERS', 'PNWRS').
ACI	Logical. If TRUE, the data from All Condition Inventories (ACI) are included in dataset (NF_SAMPLING_STATUS_CD = 1). See below for more details.
subcycle99	Logical. If TRUE, excludes plots with SUBCYCLE = 99. These plots are plots that are measured more than once and are not included in the estimation process.
stateFilter	Character string or Named list. Logical statement to use as plot and filter in sql query. Must include plot alias ('p.') and be sql syntax (e.g., 'p.COUNTYCD = 1'). If more than 1 state, stateFilter must be a named list with names as state(s) (e.g., list(Utah='p.COUNTYCD = 1').

allFilter	String. An overall filter for plot or condition data in all states in query. The expression must be R syntax (e.g., 'PLOT_STATUS_CD == 1').
alltFilter	String. If istree=TRUE, an overall filter for tree data in all states (e.g., only Whitebark pine trees - 'SPCD == 101'). Note: returns only plots with trees included in filter.
returndata	Logical. If TRUE, returns data objects.
savedata	Logical. If TRUE, saves data to outfolder as comma-delimited file (*.csv). No objects are returned. If FALSE, the data are saved as R objects and returned to user. See details for caveats.
saveqry	Logical. If TRUE, saves queries to outfolder (by state).
savePOP	Logical. If TRUE, save and return the POP_PLOT_STRATUM_ASSGN table.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE. If out_layer = NULL,
dbconn	Open database connection.
dbconnopen	Logical. If TRUE, the dbconn connection is not closed.
evalInfo	List. List object output from DBgetEvalid or DBgetXY FIESTA functions.

## Details

### FIA forest land definition

#### *Current*

Forested plots include plots with  $\geq 10$  percent cover (or equivalent stocking) by live trees of any size, including land that formerly had such tree cover and that will be naturally or artificially re-generated. To qualify, the area must be  $\geq 1.0$  acre in size and 120.0 feet wide (See Burrill et al. 2018).

#### *\*ACI (All Condition Inventory)\**

RMRS National Forest plots. For nonforest conditions that have been visited in the field (NF\_SAMPLING\_STATUS\_CD = if trees exist on the condition, the data exist in the tree table. If you do not want these trees included, ACI=FALSE. This will filter the data to only forested conditions (COND\_STATUS\_CD = 1)

#### *\*Nevada\**

In 2016, the population area of Nevada changed to exclude the large restricted area owned by Department of Defense (Area 51) from the sample. Prior to 2016, the plots within this area were observed using aerial photos and if they were definitely nonforest the plots were entered in the database with nonforest information. If they were observed as forested or potentially forested, they were given a PLOT\_STATUS\_CD=3 because they were Denied Access. From 2016 on, all plots within this area are removed from the sample, and thus, removed from database.

### FIA DataMart Data

FIA data available on FIA DataMart include the following information.

- the PLOT variable is renumbered.
- the LON/LAT coordinates are fuzzed & swapped.
- the OWNERCD variable is based on fuzzed & swapped locations.
- ECOSUBCD, CONGCD, ELEV, and EMAP\_HEX are GIS-extracted values based on fuzzed & swapped locations.

- For annual data, forested plots represent the current definition of  $\geq 10$  percent cover...
- For periodic data, forested plots are defined by a definition of Other Wooded Land (OWL), including  $\geq 5$  percent cover...

\*FIADB Table Extraction\*

<b>Argument</b>	<b>Table Name(s)</b>
istree	TREE
isveg	P2VEG_SUBPLOT_SPP, P2VEG_SUBP_STRUCTURE, INVASIVE_SUBPLOT_SPP
issubp	SUBPLOT, SUBP_COND
isdwm	COND_DWM_CALC
isgrm	TREE_GRM_COMPONENT
isscem	SUBP_COND_CHNG_MTRX

### FIA Evaluations

An evaluation is a group of plots within the FIA database that is used for generating population estimates, representing different inventory spans of data with different stratification or area adjustments. Each evaluation is determined by the type of estimation (evalType) including: area and tree estimates; growth, removal, and mortality estimates; and area change estimates (EVAL\_TYPE). These plots are identified by an evalid, which is a unique identifier in the format of a 2-digit State code, a 2-digit year code, and a 2-digit evaluation type code. For example, EVALID '491601' represents the Utah 2016 evaluation for current area estimates.

### FIA Evaluation Types

Define one or more Evaluation Type for evalCur=TRUE or evalEndyr=YYYY. An Evaluation type is used to identify a specific set of plots for a particular response that can be used to make a statistically valid sample-based estimate. If evalType="ALL", the evaluation includes all sampled and nonsampled plots or plots that were missed in an inventory year.

Regional differences may occur on how missed plots are represented in a FIA Evaluation. For example, RMRS Evaluations are static; missed plots are included in an Evaluation as nonsampled, and when measured, are included in a following Evaluation. Therefore, the number of nonsampled plots in previous Evaluations may change, depending on when missed plots are measured. In the PNW Research Station, plots are brought forward to replace missed plots in an evaluation, depending on the evalType.

EVAL\_TYP

<b>EVALIDCD</b>	<b>EVAL_TYP</b>	<b>Description</b>
00	EXPALL	All area
01	EXPVOL/EXPCURR	Area/Volume

### Inventory span defining variables

Data can be extracted using FIA Evaluations or a custom-defined Evaluation for one or more states, one or more FIA Research Stations (RS), or all available states in database (states=NULL, RS=NULL).

\*FIA Evaluation\*

Argument	Description
EVALID	Specified FIA EVALID (e.g., 491801)
evalCur	Most current FIA Evaluation
evalEndyr	End year of an FIA Evaluation (e.g., 2018)
evalAll	All evaluations in database
evalType	Type of FIA Evaluation (response)

\*Custom evaluation\*

Argument	Description
measCur	Most current measurement of plot in database
measEndyr	Most current measurement of plot in database in or before year
allyrs	All years for invtype (ANNUAL/PERIODIC)
invyrs	Specified inventory years (e.g., 2015:2018)

### Spatial data

If `issp=TRUE`, an `sf` spatial object of plot-level attributes is generated from public coordinates, with NAD83 Geographic Coordinate Reference System.

\*Exporting\*

If `savedata=TRUE` and `out_fmt="shp"`, the spatial object is exported to the outfolder using the ESRI Shapefile driver. The driver truncates variable names to 10 characters or less. Variable names are changed using an internal function. The name changes are written to a csv file and saved to the outfolder (`shpfile_newnames.csv`).

\*spcond\*

Only one condition per plot is used for spatial representation of condition attributes. If `CONDID1=TRUE`, condition 1 is selected. If `CONDID1=FALSE`, the condition is selected based on the following criteria. A column named `CONDMETHOD` is added to the attribute table to show the method and steps used, identified by the abbreviation in parentheses.

- (1) minimum `COND_STATUS_CD` (`_ST`)
- (2) maximum condition proportion (`_CP`)
- (3) maximum live canopy `cvr_pct` (`_CC`)
- (4) minimum `STDSZCD` (`_SZ`)

(5) minimum CONDID (\_C1)

### Derived Variables

If defaultVars=TRUE, the following derived variables are calculated after extracting data from the FIA database.

Plot-level variables:

NBRCND - Number of conditions on plot, including nonsampled conditions (COND\_STATUS\_CD = 5)

NBRCNDSAMP - Number of sampled conditions on plot.

NBRCNDFOR - Number of sampled forested conditions on plot.

NBRCNDFTYP - Number of sampled forested conditions with different forest types on plot.

NBRCNDFGRP - Number of sampled forested conditions with different forest type groups on plot.

CCLIVEPLT - Percent live canopy cover of condition aggregated to plot-level (LIVE\_CANOPY\_CVR\_PCT \* CONDPRO

PLOT\_ID - Unique Identifier for a plot ('ID' + STATECD(2) + UNITCD(2) + COUNTYCD(3) + PLOT(5)). This variable

Condition-level variables:

FORTYGRP - TYPGRPCD merged to FORTYPCD

FLDTYGRP - TYPGRPCD merged to FLDTYPCD

FORNONSAMP - Combination of PLOT\_STATUS\_CD and PLOT\_NONSAMPLE\_REASN\_CD

QMD - Quadratic Mean Diameter

Tree-level variables:

BA - the basal area of a tree (BA = DIA \* DIA \* 0.005454)

TREE AGE Notes:

- Available for live timber and woodland trees in the following states: AZ,CO,ID,MT,NV,UT,OR,WA.

- BHAGE - Breast height age (4.5' above ground) of timber trees.

- PNW - one tree is sampled for each species, within each crown class, and for each condition class present on plot. Age of

- RMRS - one tree is sampled for each species and broad diameter class present on plot.

DRYBIO Notes:

DRYBIO\_AG - Aboveground oven-dry biomass, in pounds (DRYBIO\_AG = (DRYBIO\_BOLE + DRYBIO\_STUMP + DR

- Available for both timber and woodland species, live trees  $\geq 1.0$ " DIA and dead trees  $\geq 5.0$ " DIA. Summed dry biomass

- DRYBIO\_BOLE - dry biomass of sound wood in live and dead trees, including bark, from a 1-foot stump to a min 4-inch

- DRYBIO\_STUMP - dry biomass in the tree stump, including the portion of the tree from the ground to the bottom of mer

- DRYBIO\_TOP - dry biomass in the top of the tree, including the portion of the tree above merchantable bole, 4-inch top,
- DRYBIO\_SAPLING - dry biomass of saplings, including aboveground portion, excluding foliage, of live timber trees >=
- DRYBIO\_WDLD\_SPP - dry biomass of woodland trees, live or dead, including the aboveground portion, excluding foliage

#### ABOVEGROUND CARBON ESTIMATES (IN POUNDS)

Available for both timber and woodland species, live trees >= 1.0" DIA and dead trees >= 5.0" DIA.

Calculated as 1/2 of the aboveground estimates of biomass:

$CARBON\_AG = 0.5 * (DRYBIO\_AG)$

TREE AGE DATA ONLY IN FOR ("AZ", "CO", "ID", "MT", "NV", "UT")

FMORTCFAL includes trees >= 5.0" DIA and greater and is not populated for states("CA", "OR", "WA", "OK")

Mortality variables only available in: AZ, CO, ID, MT, NV, NM, UT, WY, ND, SD, NE, KS, OK.

**TPA** If TPA=TRUE and istree=TRUE or isseed=TRUE, the following tree/seedling variables are multiplied by trees-per-acre (TPA\_UNADJ). TPA\_UNADJ is set to a constant derived from the plot size and equals 6.018046 for trees sampled on subplots, 74.965282 for trees sampled on microplots, and 0.999188 for trees sampled on macroplots. Variable-radius plots were often used in earlier inventories, so the value in TPA\_UNADJ decreases as the tree diameter increases (FIADB User Guide)

Variables: VOLCFNET, VOLCFGRS, GROWCFGS, GROWCFAL, FGROWCFGS, FGROWCFAL, MORTCFGS, MORTCFAL, FMORTCFGS, FMORTCFAL, REMVCFGS, REMVCFAL, FREMVCFGS, FREMVCFAL, DRYBIO\_BOLE, DRYBIO\_STUMP, DRYBIO\_TOP, DRYBIO\_SAPLING, DRYBIO\_WDLD\_SPP, DRYBIO\_BG, CARBON\_BG, CARBON\_AG

#### MISC

For regions outside RMRS, there is no OWNCD attached to nonforest lands.

#### Value

if returndata=TRUE, a list of the following objects:

states	Vector. Input state(s) (full state names: Arizona).
tabs	List. A list of data frames from FIA database, including plt and cond; and tree (if istree=TRUE); seed (if isseed=TRUE), p2veg_subplot_spp, p2veg_subp_structure, and invsubp (if isveg=TRUE), lulc (if islulc=TRUE). See below 'Output Tables - FIA Table Names' for reference to FIA database tables. See FIESTA::ref_* for variable descriptions (e.g., FIESTA::ref_tree). If istree and the number of states > 3, tree data are saved to outfolder and not returned to accommodate R memory issues.
xy*_PUBLIC	Data frame. XY data from FIA's public database. If measCur=TRUE, named xy-Cur_PUBLIC, else named xy_PUBLIC. The data frame has 10 columns ('PLT_CN', 'LON_PUBLIC', 'LAT_PUBLIC', 'STATECD', 'UNITCD', 'COUNTYCD', 'PLOT', 'INTENSITY', 'PLOT_ID' (ID+STATECD+UNTCD+COUNTYCD+PLOT), 'COUNTYFIPS'). If issp=TRUE, returns an sf object.
sponddat	If spond=TRUE, the condition variables representing each plot for spatial display. For plots with multiple conditions, the selected condition is based on CON-DID=1 (if spondid1=TRUE) or a set if criteria defined in Details - spond (if spondid1=FALSE).

evalid	Number. If evalCur=TRUE or evalEndyr is not NULL, the Evaluation ID from the FIA database used to define the output data.
pltcnt	Data frame. Number of plots (NBRPLOTS) by state, cycle, inventory year, and plot status.
pop_plot_stratum_assgn	Data frame. If savePOP=TRUE, and FIA Evaluations are used to extract data from database, return the POP_PLOT_STRATUM_ASSGN table or, if more than one evalType and savePOP=FALSE. If more than one evalType, only the records for the evalTypes are returned, otherwise all evalTypes for the state evaluation are returned.

\*Output Tables - FIA Table Names\*

<b>tab</b>	<b>FIA Table</b>
plt	plot
cond	cond
tree	tree
p2veg_subplot_spp	P2VEG_SUBPLOT_SPP
p2veg_subp_structure	P2VEG_SUBP_STRUCTURE
invsubp	INVASIVE_SUBPLOT_SPP
subplot	SUBPLOT
subp_cond	SUBP_COND
cond_dwm_calc	COND_DWM_CALC
grm	TREE_GRM_COMPONENT
issccm	SUBP_COND_CHNG_MTRX

#\* Outputs to outfolder (if savedata=TRUE):

- If saveqry=TRUE, text file(s) of SQL queries used to extract data from database (\_.txt). Note: one query is used for extract
- CSV file of plot and condition counts (pltcnt\*.txt).
- Layers in a database or CSV files of output tables.
- If issp=TRUE, a feature class or ESRI shapefile of plot-level level attributes. If shapefile (.shp), variable names are truncated
- If issp=TRUE and out\_fmt='sqlite', the SQLite data is SpatialLite.

To deal with limitations of R object size and/or computer memory issues, if istree=TRUE and more than three states are desired, the tree data are saved to a CSV file, with no tree data object returned.

**Note**

If no parameters are included, the user is prompted for input. If partial parameters, the default parameter values are used for those not specified.

**Data Access** All data are downloaded from FIA's publicly-available online Datamart (<https://apps.fs.usda.gov/fia/datamart/CS>)

Because of FIA's confidentiality agreement to protect the privacy of landowners as well as protecting the scientific integrity of FIA's sample design, the exact coordinates of the sample plot locations are

not included. The X/Y coordinates (LON\_PUBLIC/LAT\_PUBLIC) for download are perturbed up to a mile from the original location (<https://www.fia.fs.fed.us/tools-data/spatial/Policy/index.php>). If the exact location of the plots are necessary for your analysis, contact FIA's Spatial Data Services (<https://www.fia.fs.fed.us/tools-data/spatial/index.php>).

## End(Not run)

```

---

DBgetSQLite

*Database - Queries a SQLite database table.*

---

### Description

Extracts and queries data from a SQLite (\*.sqlite) database (Note: must use SQL syntax).

### Usage

```
DBgetSQLite(states = NULL, outfolder = NULL)
```

### Arguments

states	String. Vector of one or more state names.
outfolder	String. The output folder path. If NULL, outfolder is the working directory.

### Value

Returns nothing.

### Author(s)

Tracey S. Frescino

### Examples

```

## Not run:
# Extract data from Washington state
DBgetSQLite(states = "WA")

# Extract data from Utah and California, save to an outfolder
DBgetSQLite(states = c("UT", "CA"),
            outfolder = tempdir())

## End(Not run)

```

---

 DBgetStrata

*Database - Gets stratification information from FIA database.*

---

### Description

Gets strata information from FIA's Oracle database or FIA DataMart, including: (1) strata and estimation unit assignment per plot; (2) total area by estimation unit; (3) pixel counts and number plots by strata/estimation unit. Include a data frame of plots, states, or evaluation information.

### Usage

```
DBgetStrata(
  dat = NULL,
  uniqueid = "CN",
  datasource = "datamart",
  data_dsn = NULL,
  states = NULL,
  eval_opts = eval_options(Cur = TRUE),
  savedata = FALSE,
  getassgn = TRUE,
  pop_plot_stratum_assgn = NULL,
  savedata_opts = NULL,
  dbconn = NULL,
  dbconnopen = FALSE,
  evalInfo = NULL
)
```

### Arguments

dat	Data frame, comma-delimited file (*.csv), or shapefile (*.shp). The strata value is merged to this table and returned as a data frame. See details for necessary variables.
uniqueid	String. The unique plot identifier of dat (e.g., 'CN').
datasource	String. Source of data ('datamart', 'sqlite').
data_dsn	String. If datasource='sqlite', the name of SQLite database (*.sqlite).
states	String or numeric vector. Name(s) (e.g., 'Arizona','New Mexico') or code(s) (e.g., 4, 35) of states for strata if dat=NULL.
eval_opts	List of evaluation options for 'FIA' or 'custom' evaluations to determine the set of data returned. See help(eval_options) for a list of options.
savedata	Logical. If TRUE, writes output to outfolder.
getassgn	Logical. If TRUE, extracts plot assignments from pop_plot_stratum_assgn table in database.
pop_plot_stratum_assgn	Data frame. The pop_plot_stratum_assgn for state(s).

savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE.
dbconn	Open database connection.
dbconnopen	Logical. If TRUE, the dbconn connection is not closed.
evalInfo	List. List object output from DBgetEvalid or DBgetXY FIESTA functions.

## Details

Dependent packages: DBI, rgdal

The following variables must be present in dat: STATECD, UNITCD, INVYR, a uniqueid (ex. "PLT\_CN"), and PLOT\_STATUS\_CD (if nonsampled plots in dataset).

FIADB TABLES USED:

FS_FIADB.SURVEY	To get latest inventory year.
FS_FIADB.POP_EVAL	To get EVALID and EVALID years.
FS_FIADB.POP_ESTN_UNIT	To get total area by estimation unit (AREATOT_EU-includes water).
FS_FIADB.POP_STRATUM	To get pixel counts by stratum and estimation unit.
FS_FIADB.POP_PLOT_STRATUM_ASSGN	To get estimation unit & stratum assignment for each plot.

Area by estimation unit includes total area for all plots (evaltype="all").

## Value

FIAstrata - a list of the following objects:

pltassgn	Data frame. Plot-level strata/estimation unit assignment. If dat is not NULL, strata/estimation unit variables are appended to dat.
pltassgnid	String. Name of unique identifier of plot in pltassgn.
unitarea	Data frame. Total acres by estimation unit.
unitvar	String. Name of the estimation unit variable (ESTN_UNIT).
areavar	String. Name of the acre variable (ACRES).
stratalut	Data frame. Strata look-up table with summarized pixel counts (PIPOINTCNT) by strata/estimation unit.
strvar	String. Name of the strata variable (STRATA).
strwtvar	String. Name of the strata weight variable (PIPOINTCNT).
evalid	List. evalid by state.

Outputs to outfolder (if savedata=TRUE):

- CSV file of pltassgn (\*'date'.csv).
- CSV file of unitarea (\*'date'.csv).
- CSV file of stratalut (\*'date'.csv).
- If collapsed, a CSV file of original classes and new collapsed classes.

**Note**

Steps used in data extraction:

1. Get EVALID and EVALID years by state - DBgetEvalid().
2. unitarea: get total area by estimation unit for EVALID (POP\_ESTN\_UNIT).
3. stratalut: get pixel counts by estimation unit and stratum for EVALID (POP\_STRATUM).
4. pltassgn: get estimation unit and stratum assignment for each plot for EVALID. (POP\_PLOT\_STRATUM\_ASSGN).
5. If dat is not NULL, merge pltassgn assignment to dat.
6. Merge number of plots to stratalut
7. Check for only 1 MEASYEAR or 1 INVYR and number of plots by strata/estimation unit. If less than minimumum plots per strata/estimation unit collapse using the following algorithm.

Strata collapsing:

If there are less than minplotnum (10) plots in the smallest strata of the estimation unit, these plots are grouped with the larger strata in the same estimation unit and defined as the highest strata value. If, after grouping, there are still less than minplotnum, all of these plots are combined with the corresponding strata of the estimation unit above. If there are no records above, then they are combined with the estimation unit below. The process repeats, grouping the strata to the highest strata value if necessary. All grouping is restrained within survey units (UNITCD).

More than one evaluation:

If attributing a table of plots and there are plots that have been visited more than once, all plots are assigned an estimation unit and strata value, but the area and strata proportions are from the most current evaluation for the dataset. The plots outside the most current evaluation are attributes with values from the next most current evaluation occurring in the database.

**Author(s)**

Tracey S. Frescino

**Examples**

```
## Not run:
# Get strata for the most current evaluation of a state (ex. Wyoming)
WYstrat1 <- DBgetStrata(states = "Wyoming",
                       eval_opts = list(Cur = TRUE))

names(WYstrat1)

head(WYstrat1$pltassgn)
WYstrat1$unitarea
WYstrat1$unitvar
WYstrat1$areavar
WYstrat1$strvar
WYstrat1$evalid

# Get strata information for a specific set of plots
WYstrat4 <- DBgetStrata(dat = WYplt)
names(WYstrat4)
```

```

head(WYstrat4$pltassgn)
WYstrat4$unitarea
WYstrat4$evalid

## End(Not run)

```

---

DBgetXY

*Database - Extracts plot coordinates.*

---

### Description

Extracts public plot coordinates for an FIA evaluation or a custom evaluation. Plots are extracted from FIA's public Datamart (<https://apps.fs.usda.gov/fia/datamart/datamart.html>) or other defined datasource.

### Usage

```

DBgetXY(
  states = NULL,
  RS = NULL,
  xy_datsource = "datamart",
  xy_dsn = NULL,
  xy = "PLOT",
  xy_opts = xy_options(),
  datsource = NULL,
  data_dsn = NULL,
  dbTabs = dbTables(),
  pjoinid = "CN",
  eval = "FIA",
  eval_opts = eval_options(),
  invtype = "ANNUAL",
  coordType = "PUBLIC",
  intensity1 = FALSE,
  pvars2keep = NULL,
  issp = FALSE,
  returndata = TRUE,
  savedata = FALSE,
  exportsp = FALSE,
  savedata_opts = NULL,
  POP_PLOT_STRATUM_ASSGN = NULL,
  SURVEY = NULL,
  dbconnopen = FALSE,
  evalInfo = NULL
)

```

**Arguments**

states	String or numeric vector. Name (e.g., 'Arizona','New Mexico') or code (e.g., 4, 35) of state(s) for evalid. If all states in one or more FIA Research Station is desired, set states=NULL and use RS argument to define RS.
RS	String vector. Name of research station(s) to get public XY coordinates for ('RMRS','SRS','NCRS','NERS','PNWRS'). Do not use if states is populated. See FIESTA::ref_statecd for reference to RS and states.
xy_datsource	Source of XY data ('datamart', 'sqlite', 'obj', 'csv').
xy_dsn	If datsource='sqlite', the file name (data source name) of the sqlite database (*.db) where XY data reside.
xy	sf R object or String. If xy_dsn = 'datamart', name of xy table in FIA DataMart. If xy_dsn = 'sqlite', name of xy layer in database. If datsource = 'csv', full pathname of xy CSV file(s). If datsource = 'obj', name of xy R object. If datsource = 'shp', full pathname of shapefile.
xy_opts	List of xy data options for xy (e.g., xy_opts = list(xvar='LON', yvar='LAT'). See xy_options() for more options and defaults.
datsource	String. Source of FIA data for defining FIA evaluations or appending variables ('datamart', 'sqlite', 'obj', 'csv'). If datsource = NULL, datsource = xy_datsource. If datsource = 'datamart', data are downloaded extracted from FIA DataMart ( <a href="http://apps.fs.usda.gov/fia/datamart/datamart.html">http://apps.fs.usda.gov/fia/datamart/datamart.html</a> ). If datsource='sqlite', specify database name(s) in data_dsn and table name(s) in dbTabs() argument. If datsource = ('obj','csv'), specify *.csv file name in dbTabs argument.
data_dsn	String. Name of database with plot_layer and/or ppsa_layer.
dbTabs	String or R Object. If data_dsn = 'datamart', name of table(s) in FIA DataMart. If data_dsn = 'sqlite', name of layer(s) in database. If datsource = 'csv', name of CSV file(s). If datsource = 'obj', name of R object.
pjoinid	String. Variable in plot table to join to XY data, if plot_layer is not NULL. Not necessary to be unique. If using most current XY coordinates, use identifier for a plot (e.g., PLOT_ID).
eval	String. Type of evaluation time frame for data extraction ('FIA', 'custom'). See eval_opts for more further options.
eval_opts	List of evaluation options for 'FIA' or 'custom' evaluations to determine the set of data returned. See help(eval_options) for a list of options.
invtype	String. Type of FIA inventory to extract ('PERIODIC', 'ANNUAL'). Only one inventory type (PERIODIC/ANNUAL) at a time.
coordType	String. c('PUBLIC', 'ACTUAL'). Defines type of coordinates and is used for the output name.
intensity1	Logical. If TRUE, includes only XY coordinates where INTENSITY = 1 (FIA base grid).
pvars2keep	String vector. One or more variables in plot_layer to append to output.
issp	Logical. If TRUE, returns spatial XY data as a list object with query.
returndata	Logical. If TRUE, returns XY data as a list object with query.

savedata	Logical. If TRUE, saves XY data. Specify outfolder and format using savedata_opts.
exportsp	Logical. If TRUE, exports data as spatial.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE or exportsp = TRUE.
POP_PLOT_STRATUM_ASSGN	Data frame. The name of the POP_PLOT_STRATUM_ASSGN data frame object if it is already downloaded and stored in environment.
SURVEY	Data frame. The name of the SURVEY data frame object if it has been already downloaded and stored in environment.
dbconnopen	Logical. If TRUE, the dbconn connection is not closed.
evalInfo	List. List object output from DBgetEvalid or DBgetXY FIESTA functions.

**Value**

if returndata=TRUE, a list of the following objects:

xy	Data frame. XY data from database. The output name is based on coordType parameter (e.g., xy_PUBLIC). the data frame include xy.uniqueid, xvar, yvar and appended plot variables in pvars2keep if plot_layer is not NULL. The default plot variables included are 'STATECD','UNITCD','COUNTYCD','PLOT','PLOT_ID' (ID+STATECD+UNTCD+COUNTYCD+PLOT), 'COUNTYFIPS'. If issp=TRUE, returns an sf object.
xyqry	String. Query to extract coordinates.
xvar	String. Name of X variable in xy*.
yvar	String. Name of Y variable in xy*.

If savedata=TRUE, outputs the xy\* based on savedata\_opts. If exportsp=TRUE, the output xy saved as spatial layer based on savedata\_opts.

**Note**

If no parameters are included, the user is prompted for input. If partial parameters, the default parameter values are used for those not specified.

**Author(s)**

Tracey S. Frescino

**Examples**

```
## Not run:
# Most current evaluation and shapefile with public coordinates
COxylst <- DBgetXY(states = "Colorado",
                  eval = "FIA",
                  eval_opts=eval_options(Endyr = 2019))
names(COxylst)
```

```
head(COxylst$xy_PUBLIC)
COxylst$xyqry
```

```
## End(Not run)
```

---

 DBqryCSV

*Database - Queries FIA Online Database.*

---

## Description

Downloads, extracts, and queries compressed comma-delimited file(s) (\*.zip) from FIA DataMart ([https://apps.fs.usda.gov/fia/datamart/CSV/datamart\\_csv.html](https://apps.fs.usda.gov/fia/datamart/CSV/datamart_csv.html)). (Note: must use SQL syntax).

## Usage

```
DBqryCSV(sql, states = NULL, sqltables = NULL)
```

## Arguments

sql	String. A sql query. Must be appropriate sql syntax.
states	String vector. Name of state(s) in query. If not by state, set to NULL.
sqltables	String vector. Name of table(s) in sql statement to download. The sqltables must match tables in the sql statement (i.e., case-sensitive).

## Details

The compressed data files are downloaded from FIA DataMart; saved to a temporary space; extracted and imported; and deleted from temporary space. Accessibility and download time depends on access and speed of internet connection.

## Value

Returns a data frame from resulting query.

## Author(s)

Tracey S. Frescino

## Examples

```
## Not run:
# Number of plots by inventory year for the state of Wyoming
sql <- "select INVYR, count(*) AS NBRPLOTS
      from plot
      where statecd=56 group by INVYR"
DBqryCSV(sql = sql,
         states = "Wyoming",
         sqltables = "plot")

## End(Not run)
```

---

dbTables                      *List of population tables.*

---

### Description

Returns a list of user-supplied parameters and parameter values for data tables to be supplied to \*DB functions.

### Usage

```

### Arguments

plot_layer	R object, comma-delimited file(*.csv), or name of layer in database. Plot-level data (PLOT).
cond_layer	R object, comma-delimited file(*.csv), or name of layer in database. Condition-level data (COND).
tree_layer	R object, comma-delimited file(*.csv), or name of layer in database. Tree-level data (TREE).
seed_layer	R object, comma-delimited file(*.csv), or name of layer in database. Seedling data (SEEDLING).

plotgeom_layer	R object, comma-delimited file(*.csv), or name of layer in database. Plot-level GIS extracted data (PLOTGEOM).
vsubpspp_layer	R object, comma-delimited file(*.csv), or name of layer in database. Understory vegetation species data (P2VEG_SUBPLOT_SPP).
vsubpstr_layer	R object, comma-delimited file(*.csv), or name of layer in database. Understory vegetation structure data (P2VEG_SUBP_STRUCTURE).
invsubp_layer	R object, comma-delimited file(*.csv), or name of layer in database. Understory vegetation invasives data (INVASIVE_SUBPLOT_SPP).
subplot_layer	R object, comma-delimited file(*.csv), or name of layer in database. Subplot-level data (SUBPLOT).
subpcond_layer	R object, comma-delimited file(*.csv), or name of layer in database. Subplot condition-level data (SUBP_COND).
dwm_layer	R object, comma-delimited file(*.csv), or name of layer in database. Down wood material data (COND_DWM_CALC).
sccm_layer	R object, comma-delimited file(*.csv), or name of layer in database. Subplot-level change matrix data (SUBP_COND_CHNG_MTRX).
grm_layer	R object, comma-delimited file(*.csv), or name of layer in database. Tree growth, removal, mortality data (TREE_GRM_COMPONENT).
survey_layer	R object, comma-delimited file(*.csv), or name of layer in database. Population survey (SURVEY) data.
popeval_layer	R object, comma-delimited file(*.csv), or name of layer in database. Population evaluation (POP_EVAL) data.
popevalgrp_layer	R object, comma-delimited file(*.csv), or name of layer in database. Population evaluation group data (POP_EVAL_GRP).
popevaltyp_layer	R object, comma-delimited file(*.csv), or name of layer in database. Population evaluation type data (POP_EVAL_TYP).
popstratum_layer	R object, comma-delimited file(*.csv), or name of layer in database. Population stratum data (POP_STRATUM).
popestnunit_layer	R object, comma-delimited file(*.csv), or name of layer in database. Population estimation unit data (POP_ESTN_UNIT).
ppsa_layer	R object, comma-delimited file(*.csv), or name of layer in database. Population plot stratum assignment data (POP_PLOT_STRATUM_ASSGN).
refspp_layer	R object, comma-delimited file(*.csv), or name of layer in database. Reference table for species (REF_SPECIES).
other_layers	String. Other layer(s) in database to clip and/or extract from database (Note: must include PLT_CN variable as unique identifier).
...	For extensibility.

### Details

If no parameters, an empty list is returned.

**Value**

A list of user-supplied parameters and parameter values for strata.

**Author(s)**

Tracey S. Frescino

**Examples**

```
dbTables(plot_layer = FIESTA::WYplt)
```

**Description**

Reference tables - NODATA Values.

**Usage**

DEFAULT\_NODATA

**Format**

An object of class `list` of length 7.

**Source**

gdal values.

---

ecomap

*EcoMap SpatialPolygonsDataFrame*

---

**Description**

Contains regional geographic delineations for analysis of ecological relationships across ecological units. ECOMAP is the term used for a USDA Forest Service initiative to map ecological units and encourage their use in ecosystem-based approaches to forest land conservation and management. It is coordinated at the national and regional levels by USDA Forest Service staff and implemented in cooperation with State forestry agencies and others. ECOMAP mapping criteria are outlined in the National Hierarchical Framework of Ecological Units (<https://www.ncrs.fs.fed.us/gla/reports/hierarchy.htm>). The framework systematically divides the country into progressively smaller areas of land and water that have similar physical and biological characteristics and ecological processes.

**Format**

A SpatialPolygonsDataFrame with 1233 features and 3 attributes PROVINCE - Ecomap Province  
SECTION - EcoMap Section SUBSECTION - Ecomap Subsection

**Details**

The EcoMap Provinces feature class contains ecological province polygons attributed with names and descriptions. The EcomapSections 2007 data set describes the ecological sections within the conterminous United States. The EcomapSubections 2007 data set describes the ecological subsections within the conterminous United States.

Converted to simple feature

Transformed CRS from longlat(EPsg:4269) to Albers (EPsg:5070)

Saved to R object, with compression='xz'

---

modGBarea	<i>Green-Book module - Generate area estimates.</i>
-----------	---

---

**Description**

Generates area estimates by domain (and estimation unit). Calculations are based on Scott et al. 2005 ('the green-book') for mapped forest inventory plots. The non-ratio estimator for estimating area by stratum and domain is used. Plots that are totally nonsampled are excluded from estimation dataset. Next, an adjustment factor is calculated by strata to adjust for nonsampled (nonresponse) conditions that have proportion less than 1. The attribute is the proportion of the plot which is divided by the adjustment factor, and averaged by stratum. Strata means are combined using the strata weights and then expanded to area using the total land area in the population.

**Usage**

```

modGBarea(
  GBpopdat,
  landarea = "FOREST",
  pcfilter = NULL,
  rowvar = NULL,
  colvar = NULL,
  sumunits = TRUE,
  returntitle = FALSE,
  savedata = FALSE,
  table_opts = NULL,
  title_opts = NULL,
  savedata_opts = NULL,
  gui = FALSE,
  ...
)

```

**Arguments**

GBpopdat	List. Population data objects returned from modGBpop().
landarea	String. The sample area filter for estimates ("ALL", "FOREST", "TIMBERLAND"). If landarea=FOREST, filtered to COND_STATUS_CD = 1; If landarea=TIMBERLAND, filtered to SITECLCD in(1:6) and RESERVCD = 0.
pcfilter	String. A filter for plot or cond attributes (including pltassgn). Must be R logical syntax.
rowvar	String. Name of row domain variable in cond. If only one domain, rowvar = domain variable. If more than one domain, include colvar. If no domain, rowvar = NULL.
colvar	String. Name of column domain variable in cond.
sumunits	Logical. If TRUE, estimation units are summed and returned in one table.
returntitle	Logical. If TRUE, returns title(s) of the estimation table(s).
savedata	Logical. If TRUE, saves table(s) to outfolder.
table_opts	List. See help(table_options()) for a list of options.
title_opts	List. See help(title_options()) for a list of options.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE.
gui	Logical. If gui, user is prompted for parameters.
...	Parameters for modGBpop() if GBpopdat is NULL.

**Details**

If variables are NULL, then it will prompt user to input variables.

Necessary variables:

Data	Variable	Description
cond	cuniqueid	Unique identifier for each plot, to link to pltassgn (ex. PLT_CN).
	CONDID	Unique identifier of each condition on plot. Set CONDID=1, if only 1 condition per plot.
	CONDPROP_UNADJ	Unadjusted proportion of condition on each plot. Set CONDPROP_UNADJ=1, if condition is forested.
	COND_STATUS_CD	Status of each forested condition on plot (i.e. accessible forest, nonforest, water, etc).
	NF_COND_STATUS_CD	If ACI=TRUE. Status of each nonforest condition on plot (i.e. accessible nonforest, nonaccessible nonforest).
	SITECLCD	If landarea=TIMBERLAND. Measure of site productivity.
pltassgn	RESERVCD	If landarea=TIMBERLAND. Reserved status.
	puniqueid	Unique identifier for each plot, to link to cond (ex. CN).
	STATECD	Identifies state each plot is located in.
	INVYR	Identifies inventory year of each plot.
	PLOT_STATUS_CD	Status of each plot (i.e. sampled, nonsampled). If not included, all plots are assumed sampled.

For available reference tables: `sort(unique(FIESTAutils::ref_codes$VARIABLE))`

## Value

A list with estimates with percent sampling error for rowvar (and colvar). If `sumunits=TRUE` or `unitvar=NULL` and `colvar=NULL`, one data frame is returned. Otherwise, a list object is returned with the following information. If `savedata=TRUE`, all data frames are written to outfolder.

est	Data frame. Area estimates, in area units (e.g., acres), by rowvar, colvar (and estimation unit). If <code>sumunits=TRUE</code> or one estimation unit and <code>colvar=NULL</code> , or <code>allin1=TRUE</code> , estimates and percent sampling error are in one data frame.
pse	Data frame. Percent sampling errors (Confidence level 68 for estimates by rowvar and colvar (and estimation unit)).
titlelst	List. If <code>returntitle=TRUE</code> a list with table title(s). The list contains one title if est and pse are in the same table and two titles if est and pse are in separate tables. Row and column tables are also included in list.
raw	List. If <code>rawdata=TRUE</code> , a list including the processing data used for estimation including: number of plots and conditions; stratification information; and 1 to 8 tables with calculated values for table cells and totals (See processing data below).

## Raw data

plotsampcnt	Table. Number of plots by plot status (e.g., sampled forest on plot, sampled nonforest, nonsampled).
condsampcnt	DF. Number of conditions by condition status (forest land, nonforest land, non-census water, census water, nonsampled).
unitarea	DF. Area by estimation unit.
expcondtab	DF. Condition-level area expansion factors.
domdat	DF. Final data table used for estimation.
stratdat	Data frame. Strata information by estimation unit.

<b>Variable</b>	<b>Description</b>
unitvar	estimation unit
strvar	stratum value
strwtvar	number of pixels by strata and estimation unit
n.strata	number of plots in strata (after totally nonsampled plots removed)
n.total	number of plots for estimation unit
strwt	proportion of area (or plots) by strata and estimation unit (strata weight)
CONDPROP_UNADJ_SUM	summed condition proportion by strata and estimation unit
CONDPROP_ADJFAC	adjusted condition proportion by strata after nonresponse plots removed
AREA	total area for estimation unit
CONDPROP_ADJFAC	average area

#### processing data

Data frames. Separate data frames containing calculated variables used in estimation process. The number of processing tables depends on the input parameters. The tables include: total by estimation unit (unit.totest); rowvar totals (unit.rowest), colvar totals, if not NULL (unit.colvar); and a combination of rowvar and colvar, if colvar is not NULL (unit.grpvar). If sumunits=TRUE, the raw data for the summed estimation units are also included (totest, rowest, colest, grppest, respectively). These tables do not included estimate proportions (nhat and nhat.var).

The data frames include the following information:

<b>Variable</b>	<b>Description</b>
nhat	estimate proportion of land
nhat.var	variance estimate of estimated proportion of land
NBRPLT.gt0	Number of non-zero plots used in estimates
AREA	total area for estimation unit
est	estimated area of land $nhat \cdot areavar$
est.var	variance estimate of estimate acres of land $nhat.var \cdot areavar^2$
est.se	standard error of estimated area of land $\sqrt{est.var}$
est.cv	coefficient of variation of estimated area of land $est.se/est$
pse	percent sampling error of estimate $est.cv \cdot 100$
CI99left	left tail of 99 percent confidence interval for estimated area
CI99right	right tail of 99 percent confidence interval for estimated area
CI95left	left tail of 95 percent confidence interval for estimated area
CI95right	right tail of 95 percent confidence interval for estimated area
CI67left	left tail of 67 percent confidence interval for estimated area
CI67right	right tail of 67 percent confidence interval for estimated area

#### savedata

if savedata=TRUE...

tables with estimate and percent standard error will be written as \*csv files to outfolder. if rawdata=TRUE, the rawdata will be output to the outfolder in a folder named rawdata (if raw\_fmt="csv") or a database in the outfolder, if (raw\_fmt != "csv").

if outfn.pre is not null...

a prefix is added to output files if `raw_fmt = 'csv'`, prefix is added to file names in rawdata folder if `raw_fmt != 'csv'`, prefix is added to dsn name

## Note

### ADJUSTMENT FACTOR:

The adjustment factor is necessary to account for nonsampled conditions. It is calculated for each estimation unit by strata by summing the unadjusted condition proportions (`CONDPROP_UNADJ`) and dividing by the number of plots in the strata/estimation unit.

If `ACI=FALSE`, only nonsampled forest conditions are accounted for in the adjustment factor.

If `ACI=TRUE`, the nonsampled nonforest conditions are removed as well and accounted for in adjustment factor. This is if you are interested in estimates for all lands or nonforest lands in the All-Condition-Inventory.

### STRATA:

Stratification is used to reduce variance in population estimates by partitioning the population into homogenous classes (strata), such as forest and nonforest. For stratified sampling methods, the strata sizes (weights) must be either known or estimated. Remotely-sensed data is often used to generate strata weights with proportion of pixels by strata. If stratification is desired (`strata=TRUE`), the required data include: stratum assignment for the center location of each plot, stored in either `pltassgn` or `cond`; and a look-up table with the area or proportion of the total area of each strata value by estimation unit, making sure the name of the strata (and estimation unit) variable and values match the plot assignment name(s) and value(s).

### sumunits:

An estimation unit is a population, or area of interest, with known area and number of plots. Individual counties or combined Super-counties are common estimation units for FIA. An estimation unit may also be a subpopulation of a larger population (e.g., Counties within a State). Subpopulations are mutually exclusive and independent within a population, therefore estimated totals and variances are additive. For example, State-level estimates are generated by summing estimates from all subpopulations within the State (Bechtold and Patterson. 2005. Chapter 2). Each plot must be assigned to only one estimation unit.

If `sumunits=TRUE`, estimates are generated by estimation unit, summed together, and returned as one estimate. If `rawdata=TRUE`, estimates by individual estimation unit are also returned.

If `sumunits=FALSE`, estimates are generated and returned by estimation unit as one data frame. If `savedata=TRUE`, a separate file is written for each estimation unit.

### stratcombine:

If `TRUE` and less than 2 plots in any one estimation unit, all estimation units with 10 or less plots are combined. The current method for combining is to group the estimation unit with less than 10 plots with the estimation unit following in consecutive order (numeric or alphabetical), restrained by survey unit (`UNITCD`) if included in dataset, and continuing until the number of plots equals 10. If there are no estimation units following in order, it is combined with the estimation unit previous in order.

### rowlut/collut:

There are several objectives for including rowlut/collut look-up tables: 1) to include descriptive names that match row/column codes in the input table; 2) to use number codes that match row/column names in the input table for ordering rows; 3) to add rows and/or columns with 0 values for consistency. No duplicate names are allowed.

Include 2 columns in the table:

1-the merging variable with same name as the variable in the input merge table;

2-the ordering or descriptive variable.

If the ordering variable is the rowvar/colvar in the input table and the descriptive variable is in rowlut/collut, set row.orderby/col.orderby equal to rowvar/colvar. If the descriptive variable is the rowvar/colvar in the input table, and the ordering code variable is in rowlut/collut, set row.orderby/col.orderby equal to the variable name of the code variable in rowlut/collut.

 modGBdwm

*Green-Book module - Generate area estimates.*

---

### Description

Generates area estimates by domain (and estimation unit). Calculations are based on Scott et al. 2005 ('the green-book') for mapped forest inventory plots. The non-ratio estimator for estimating area by stratum and domain is used. Plots that are totally nonsampled are excluded from estimation dataset. Next, an adjustment factor is calculated by strata to adjust for nonsampled (nonresponse) conditions that have proportion less than 1. The attribute is the proportion of the plot which is divided by the adjustment factor, and averaged by stratum. Strata means are combined using the strata weights and then expanded to area using the total land area in the population.

### Usage

```

modGBdwm(
  GBpopdat = NULL,
  dwmtype = "CWD",
  dwmvar = "VOLCF",
  peracre = FALSE,
  lbs2tons = FALSE,
  landarea = "FOREST",
  pcfilter = NULL,
  vfilter = NULL,
  rowvar = NULL,
  colvar = NULL,
  sumunits = TRUE,
  returntitle = FALSE,
  savedata = FALSE,
  table_opts = NULL,
  title_opts = NULL,
  savedata_opts = NULL,
  gui = FALSE,
  ...
)

```

### Arguments

GBpopdat	List. Population data objects returned from modGBpop().
dwmtype	String. Type of dwm estimate ('CWD', 'FWD_LG', 'FWD_MD', 'FWD_SM').
dwmvar	String. Type of dwm estimate ('VOLCF', 'BIOMASS', 'CARBON').
peracre	Logical. If TRUE, generates per-acre estimates.
lbs2tons	Logical. If TRUE, converts biomass or carbon variables from pounds to tons. If metric=TRUE, converts to metric tons, else short tons.

landarea	String. The sample area filter for estimates ("ALL", "FOREST", "TIMBERLAND"). If landarea=FOREST, filtered to COND_STATUS_CD = 1; If landarea=TIMBERLAND, filtered to SITECLCD in(1:6) and RESERVCD = 0.
pcfilter	String. A filter for plot or cond attributes (including pltassgn). Must be R logical syntax.
vfilter	String. A filter for the P2 vegetation table used for estimate. Must be R logical syntax.
rowvar	String. Name of row domain variable in cond. If only one domain, rowvar = domain variable. If more than one domain, include colvar. If no domain, rowvar = NULL.
colvar	String. Name of column domain variable in cond.
sumunits	Logical. If TRUE, estimation units are summed and returned in one table.
returntitle	Logical. If TRUE, returns title(s) of the estimation table(s).
savedata	Logical. If TRUE, saves table(s) to outfolder.
table_opts	List. See help(table_options()) for a list of options.
title_opts	List. See help(title_options()) for a list of options.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE.
gui	Logical. If gui, user is prompted for parameters.
...	Parameters for modGBpop() if GBpopdat is NULL.

## Details

If variables are NULL, then it will prompt user to input variables.

Necessary variables:

Data	Variable	Description
cond	cuniqueid	Unique identifier for each plot, to link to pltassgn (ex. PLT_CN).
	CONDID	Unique identifier of each condition on plot. Set CONDID=1, if only 1 condition per plot.
	CONDPROP_UNADJ	Unadjusted proportion of condition on each plot. Set CONDPROP_UNADJ=1, if only 1 condition per plot.
	COND_STATUS_CD	Status of each forested condition on plot (i.e. accessible forest, nonforest, water, etc).
	NF_COND_STATUS_CD	If ACI=TRUE. Status of each nonforest condition on plot (i.e. accessible nonforest, etc).
	SITECLCD	If landarea=TIMBERLAND. Measure of site productivity.
pltassgn	RESERVCD	If landarea=TIMBERLAND. Reserved status.
	puniqueid	Unique identifier for each plot, to link to cond (ex. CN).
	STATECD	Identifies state each plot is located in.
	INVYR	Identifies inventory year of each plot.
	PLOT_STATUS_CD	Status of each plot (i.e. sampled, nonsampled). If not included, all plots are assumed sampled.

For available reference tables: `sort(unique(FIESTAutils::ref_codes$VARIABLE))`

**Value**

A list with estimates with percent sampling error for rowvar (and colvar). If sumunits=TRUE or unitvar=NULL and colvar=NULL, one data frame is returned. Otherwise, a list object is returned with the following information. If savedata=TRUE, all data frames are written to outfolder.

est	Data frame. Area estimates, in area units (e.g., acres), by rowvar, colvar (and estimation unit). If sumunits=TRUE or one estimation unit and colvar=NULL, or allin1=TRUE, estimates and percent sampling error are in one data frame.
pse	Data frame. Percent sampling errors (Confidence level 68 unit).
titlelst	List. If returntitle=TRUE a list with table title(s). The list contains one title if est and pse are in the same table and two titles if est and pse are in separate tables. Row and column tables are also included in list.
raw	List. If rawdata=TRUE, a list including the processing data used for estimation including: number of plots and conditions; stratification information; and 1 to 8 tables with calculated values for table cells and totals (See processing data below).

**Raw data**

plotsampcnt	Table. Number of plots by plot status (e.g., sampled forest on plot, sampled nonforest, nonsampled).
condsampcnt	DF. Number of conditions by condition status (forest land, nonforest land, non-census water, census water, nonsampled).
unitarea	DF. Area by estimation unit.
expcondtab	DF. Condition-level area expansion factors.
domdat	DF. Final data table used for estimation.
stratdat	Data frame. Strata information by estimation unit.

**Variable****Description**

unitvar	estimation unit
strvar	stratum value
strwtvar	number of pixels by strata and estimation unit
n.strata	number of plots in strata (after totally nonsampled plots removed)
n.total	number of plots for estimation unit
strwt	proportion of area (or plots) by strata and estimation unit (strata weight)
CONDPROP_UNADJ_SUM	summed condition proportion by strata and estimation unit
CONDPROP_ADJFAC	adjusted condition proportion by strata after nonresponse plots removed
AREA	total area for estimation unit
CONDPROP_ADJFAC	average area

**processing data**

Data frames. Separate data frames containing calculated variables used in estimation process. The number of processing tables depends on the input parameters. The tables include: total by estimation unit (unit.totest); rowvar totals (unit.rowest), colvar totals, if not NULL (unit.colvar); and a combination of row-

var and colvar, if colvar is not NULL (unit.grpvar). If sumunits=TRUE, the raw data for the summed estimation units are also included (totest, rowest, colest, grpest, respectively). These tables do not included estimate proportions (nhat and nhat.var).

The data frames include the following information:

Variable	Description
nhat	estimate proportion of land
nhat.var	variance estimate of estimated proportion of land
NBRPLT.gt0	Number of non-zero plots used in estimates
AREA	total area for estimation unit
est	estimated area of land $nhat*areavar$
est.var	variance estimate of estimate acres of land $nhat.var*areavar^2$
est.se	standard error of estimated area of land $\sqrt{est.var}$
est.cv	coefficient of variation of estimated area of land $est.se/est$
pse	percent sampling error of estimate $est.cv*100$
CI99left	left tail of 99 percent confidence interval for estimated area
CI99right	right tail of 99 percent confidence interval for estimated area
CI95left	left tail of 95 percent confidence interval for estimated area
CI95right	right tail of 95 percent confidence interval for estimated area
CI67left	left tail of 67 percent confidence interval for estimated area
CI67right	right tail of 67 percent confidence interval for estimated area

savedata

if savedata=TRUE...

tables with estimate and percent standard error will be written as \*.csv files to outfolder. if rawdata=TRUE, the rawdata will be output to the outfolder in a folder named rawdata (if raw\_fmt="csv") or a database in the outfolder, if (raw\_fmt != "csv").

if outfn.pre is not null...

a prefix is added to output files if raw\_fmt = 'csv', prefix is added to file names in rawdata folder if raw\_fmt != 'csv', prefix is added to dsn name

## Note

### ADJUSTMENT FACTOR:

The adjustment factor is necessary to account for nonsampled conditions. It is calculated for each estimation unit by strata by summing the unadjusted condition proportions (CONDPROP\_UNADJ) and dividing by the number of plots in the strata/estimation unit.

If ACI=FALSE, only nonsampled forest conditions are accounted for in the adjustment factor.

If ACI=TRUE, the nonsampled nonforest conditions are removed as well and accounted for in adjustment factor. This is if you are interested in estimates for all lands or nonforest lands in the All-Condition-Inventory.

### STRATA:

Stratification is used to reduce variance in population estimates by partitioning the population into homogenous classes (strata), such as forest and nonforest. For stratified sampling methods, the strata sizes (weights) must be either known or estimated. Remotely-sensed data is often used to generate strata weights with proportion of pixels by strata. If stratification is desired (strata=TRUE),

the required data include: stratum assignment for the center location of each plot, stored in either `pltassgn` or `cond`; and a look-up table with the area or proportion of the total area of each strata value by estimation unit, making sure the name of the strata (and estimation unit) variable and values match the plot assignment name(s) and value(s).

`sumunits`:

An estimation unit is a population, or area of interest, with known area and number of plots. Individual counties or combined Super-counties are common estimation units for FIA. An estimation unit may also be a subpopulation of a larger population (e.g., Counties within a State). Subpopulations are mutually exclusive and independent within a population, therefore estimated totals and variances are additive. For example, State-level estimates are generated by summing estimates from all subpopulations within the State (Bechtold and Patterson. 2005. Chapter 2). Each plot must be assigned to only one estimation unit.

If `sumunits=TRUE`, estimates are generated by estimation unit, summed together, and returned as one estimate. If `rawdata=TRUE`, estimates by individual estimation unit are also returned.

If `sumunits=FALSE`, estimates are generated and returned by estimation unit as one data frame. If `savedata=TRUE`, a separate file is written for each estimation unit.

`stratcombine`:

If `TRUE` and less than 2 plots in any one estimation unit, all estimation units with 10 or less plots are combined. The current method for combining is to group the estimation unit with less than 10 plots with the estimation unit following in consecutive order (numeric or alphabetical), restrained by survey unit (`UNITCD`) if included in dataset, and continuing until the number of plots equals 10. If there are no estimation units following in order, it is combined with the estimation unit previous in order.

`rowlut/collut`:

There are several objectives for including `rowlut/collut` look-up tables: 1) to include descriptive names that match row/column codes in the input table; 2) to use number codes that match row/column names in the input table for ordering rows; 3) to add rows and/or columns with 0 values for consistency. No duplicate names are allowed.

Include 2 columns in the table:

1-the merging variable with same name as the variable in the input merge table;

2-the ordering or descriptive variable.

If the ordering variable is the `rowvar/colvar` in the input table and the descriptive variable is in `rowlut/collut`, set `row.orderby/col.orderby` equal to `rowvar/colvar`. If the descriptive variable is the `rowvar/colvar` in the input table, and the ordering code variable is in `rowlut/collut`, set `row.orderby/col.orderby` equal to the variable name of the code variable in `rowlut/collut`.

---

 modGBp2veg

*Green-Book module - Generate area estimates.*

---

### Description

Generates area estimates by domain (and estimation unit). Calculations are based on Scott et al. 2005 ('the green-book') for mapped forest inventory plots. The non-ratio estimator for estimating area by stratum and domain is used. Plots that are totally nonsampled are excluded from estimation dataset. Next, an adjustment factor is calculated by strata to adjust for nonsampled (nonresponse) conditions that have proportion less than 1. The attribute is the proportion of the plot which is divided by the adjustment factor, and averaged by stratum. Strata means are combined using the strata weights and then expanded to area using the total land area in the population.

### Usage

```
modGBp2veg(
  GBpopdat = NULL,
  p2vegtype = "str",
  peracre = FALSE,
  landarea = "FOREST",
  pcfilter = NULL,
  vfilter = NULL,
  rowvar = NULL,
  colvar = NULL,
  sumunits = TRUE,
  returntitle = FALSE,
  savedata = FALSE,
  table_opts = NULL,
  title_opts = NULL,
  savedata_opts = NULL,
  gui = FALSE,
  ...
)
```

### Arguments

GBpopdat	List. Population data objects returned from modGBpop().
p2vegtype	String. Type of p2veg estimate ('str', 'spp').
peracre	Logical. If TRUE, generates per-acre estimates.
landarea	String. The sample area filter for estimates ("ALL", "FOREST", "TIMBERLAND"). If landarea=FOREST, filtered to COND_STATUS_CD = 1; If landarea=TIMBERLAND, filtered to SITECLCD in(1:6) and RESERVCD = 0.
pcfilter	String. A filter for plot or cond attributes (including pltassgn). Must be R logical syntax.
vfilter	String. A filter for the P2 vegetation table used for estimate. Must be R logical syntax.

rowvar	String. Name of row domain variable in cond (e.g., 'FORTYPCD') or P2VEG_SUBP_STRUCTURE (e.g., 'GROWTH_HABIT_CD', 'LAYER') or P2VEG_SUBPLOT_SPP (e.g., 'VEG_FLDSPCD', 'VEG_SPCD', 'GROWTH_HABIT_CD', 'LAYER'). If only one domain, rowvar = domain variable. If more than one domain, include colvar. If no domain, rowvar = NULL.
colvar	String. Name of column domain variable in cond.
sumunits	Logical. If TRUE, estimation units are summed and returned in one table.
returntitle	Logical. If TRUE, returns title(s) of the estimation table(s).
savedata	Logical. If TRUE, saves table(s) to outfolder.
table_opts	List. See help(table_options()) for a list of options.
title_opts	List. See help(title_options()) for a list of options.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE.
gui	Logical. If gui, user is prompted for parameters.
...	Parameters for modGBpop() if GBpopdat is NULL.

## Details

If variables are NULL, then it will prompt user to input variables.

Necessary variables:

Data	Variable	Description
cond	cuniqueid	Unique identifier for each plot, to link to pltassgn (ex. PLT_CN).
	CONDID	Unique identifier of each condition on plot. Set CONDID=1, if only 1 condition per plot.
	CONDPROP_UNADJ	Unadjusted proportion of condition on each plot. Set CONDPROP_UNADJ=1, if only 1 condition per plot.
	COND_STATUS_CD	Status of each forested condition on plot (i.e. accessible forest, nonforest, water, etc).
	NF_COND_STATUS_CD	If ACI=TRUE. Status of each nonforest condition on plot (i.e. accessible nonforest, etc).
	SITECLCD	If landarea=TIMBERLAND. Measure of site productivity.
	RESERVCD	If landarea=TIMBERLAND. Reserved status.
pltassgn	puniqueid	Unique identifier for each plot, to link to cond (ex. CN).
	STATECD	Identifies state each plot is located in.
	INVYR	Identifies inventory year of each plot.
	PLOT_STATUS_CD	Status of each plot (i.e. sampled, nonsampled). If not included, all plots are assumed sampled.

For available reference tables: sort(unique(FIESTAutils::ref\_codes\$VARIABLE))

## Value

A list with estimates with percent sampling error for rowvar (and colvar). If sumunits=TRUE or unitvar=NULL and colvar=NULL, one data frame is returned. Otherwise, a list object is returned with the following information. If savedata=TRUE, all data frames are written to outfolder.

est                      Data frame. Area estimates, in area units (e.g., acres), by rowvar, colvar (and

	estimation unit). If sumunits=TRUE or one estimation unit and colvar=NULL, or allin1=TRUE, estimates and percent sampling error are in one data frame.
pse	Data frame. Percent sampling errors (Confidence level 68 unit).
titlelst	List. If returntitle=TRUE a list with table title(s). The list contains one title if est and pse are in the same table and two titles if est and pse are in separate tables. Row and column tables are also included in list.
raw	List. If rawdata=TRUE, a list including the processing data used for estimation including: number of plots and conditions; stratification information; and 1 to 8 tables with calculated values for table cells and totals (See processing data below).
Raw data	
plotsampcnt	Table. Number of plots by plot status (e.g., sampled forest on plot, sampled nonforest, nonsampled).
condsampcnt	DF. Number of conditions by condition status (forest land, nonforest land, non-census water, census water, nonsampled).
unitarea	DF. Area by estimation unit.
expcondtab	DF. Condition-level area expansion factors.
domdat	DF. Final data table used for estimation.
stratdat	Data frame. Strata information by estimation unit.

<b>Variable</b>	<b>Description</b>
unitvar	estimation unit
strvar	stratum value
strwtvar	number of pixels by strata and estimation unit
n.strata	number of plots in strata (after totally nonsampled plots removed)
n.total	number of plots for estimation unit
strwt	proportion of area (or plots) by strata and estimation unit (strata weight)
CONDPROP_UNADJ_SUM	summed condition proportion by strata and estimation unit
CONDPROP_ADJFAC	adjusted condition proportion by strata after nonresponse plots removed
AREA	total area for estimation unit
CONDPROP_ADJFAC	average area

#### processing data

Data frames. Separate data frames containing calculated variables used in estimation process. The number of processing tables depends on the input parameters. The tables include: total by estimation unit (unit.totest); rowvar totals (unit.rowest), colvar totals, if not NULL (unit.colvar); and a combination of rowvar and colvar, if colvar is not NULL (unit.grpvar). If sumunits=TRUE, the raw data for the summed estimation units are also included (totest, rowest, colest, grpest, respectively). These tables do not included estimate proportions (nhat and nhat.var).

The data frames include the following information:

Variable	Description
nhat	estimate proportion of land
nhat.var	variance estimate of estimated proportion of land
NBRPLT.gt0	Number of non-zero plots used in estimates
AREA	total area for estimation unit
est	estimated area of land $nhat*areavar$
est.var	variance estimate of estimate acres of land $nhat.var*areavar^2$
est.se	standard error of estimated area of land $\sqrt{est.var}$
est.cv	coefficient of variation of estimated area of land $est.se/est$
pse	percent sampling error of estimate $est.cv*100$
CI99left	left tail of 99 percent confidence interval for estimated area
CI99right	right tail of 99 percent confidence interval for estimated area
CI95left	left tail of 95 percent confidence interval for estimated area
CI95right	right tail of 95 percent confidence interval for estimated area
CI67left	left tail of 67 percent confidence interval for estimated area
CI67right	right tail of 67 percent confidence interval for estimated area

savedata

if savedata=TRUE...

tables with estimate and percent standard error will be written as \*.csv files to outfolder. if rawdata=TRUE, the rawdata will be output to the outfolder in a folder named rawdata (if raw\_fmt="csv") or a database in the outfolder, if (raw\_fmt != "csv").

if outfn.pre is not null...

a prefix is added to output files if raw\_fmt = 'csv', prefix is added to file names in rawdata folder if raw\_fmt != 'csv', prefix is added to dsn name

## Note

### ADJUSTMENT FACTOR:

The adjustment factor is necessary to account for nonsampled conditions. It is calculated for each estimation unit by strata by summing the unadjusted condition proportions (CONDPROP\_UNADJ) and dividing by the number of plots in the strata/estimation unit.

If ACI=FALSE, only nonsampled forest conditions are accounted for in the adjustment factor.

If ACI=TRUE, the nonsampled nonforest conditions are removed as well and accounted for in adjustment factor. This is if you are interested in estimates for all lands or nonforest lands in the All-Condition-Inventory.

### STRATA:

Stratification is used to reduce variance in population estimates by partitioning the population into homogenous classes (strata), such as forest and nonforest. For stratified sampling methods, the strata sizes (weights) must be either known or estimated. Remotely-sensed data is often used to generate strata weights with proportion of pixels by strata. If stratification is desired (strata=TRUE), the required data include: stratum assignment for the center location of each plot, stored in either pltassgn or cond; and a look-up table with the area or proportion of the total area of each strata value by estimation unit, making sure the name of the strata (and estimation unit) variable and values match the plot assignment name(s) and value(s).

### sumunits:

An estimation unit is a population, or area of interest, with known area and number of plots. Indi-

vidual counties or combined Super-counties are common estimation units for FIA. An estimation unit may also be a subpopulation of a larger population (e.g., Counties within a State). Subpopulations are mutually exclusive and independent within a population, therefore estimated totals and variances are additive. For example, State-level estimates are generated by summing estimates from all subpopulations within the State (Bechtold and Patterson. 2005. Chapter 2). Each plot must be assigned to only one estimation unit.

If `sumunits=TRUE`, estimates are generated by estimation unit, summed together, and returned as one estimate. If `rawdata=TRUE`, estimates by individual estimation unit are also returned.

If `sumunits=FALSE`, estimates are generated and returned by estimation unit as one data frame. If `savedata=TRUE`, a separate file is written for each estimation unit.

`stratcombine`:

If `TRUE` and less than 2 plots in any one estimation unit, all estimation units with 10 or less plots are combined. The current method for combining is to group the estimation unit with less than 10 plots with the estimation unit following in consecutive order (numeric or alphabetical), restrained by survey unit (`UNITCD`) if included in dataset, and continuing until the number of plots equals 10. If there are no estimation units following in order, it is combined with the estimation unit previous in order.

`rowlut/collut`:

There are several objectives for including `rowlut/collut` look-up tables: 1) to include descriptive names that match row/column codes in the input table; 2) to use number codes that match row/column names in the input table for ordering rows; 3) to add rows and/or columns with 0 values for consistency. No duplicate names are allowed.

Include 2 columns in the table:

1-the merging variable with same name as the variable in the input merge table;

2-the ordering or descriptive variable.

If the ordering variable is the `rowvar/colvar` in the input table and the descriptive variable is in `rowlut/collut`, set `row.orderby/col.orderby` equal to `rowvar/colvar`. If the descriptive variable is the `rowvar/colvar` in the input table, and the ordering code variable is in `rowlut/collut`, set `row.orderby/col.orderby` equal to the variable name of the code variable in `rowlut/collut`.

Asheville, NC: U.S. Department of Agriculture, Forest Service, Southern Research Station, p.53-77.

## Description

Generates population data for generating 'green-book' estimates (Scott et al. 2005). Plots that are totally nonsampled are excluded from estimation dataset. Next, an adjustment factor is calculated by strata to adjust for nonsampled (nonresponse) conditions that have proportion less than 1. Attributes adjusted to a per-acre value are summed by plot, divided by the adjustment factor, and averaged by stratum. Strata means are combined using the strata weights and then expanded to using the total land area in the population.

## Usage

```
modGBpop(
  popType = "VOL",
  popTabs = popTables(),
  popTabIDs = popTableIDs(),
  popFilter = popFilters(),
  pltassgn = NULL,
  pltassgnid = "PLT_CN",
  dsn = NULL,
  pjoinid = "CN",
  areawt = "CONDPROP_UNADJ",
  adj = "samp",
  unitvar = NULL,
  unitarea = NULL,
  areavar = "ACRES",
  strata = TRUE,
  stratalut = NULL,
  strvar = "STRATUMCD",
  savedata = FALSE,
  saveobj = FALSE,
  objnm = "GBpopdat",
  unit_opts = NULL,
  strata_opts = NULL,
  savedata_opts = NULL,
  GBdata = NULL,
  pltdat = NULL,
  stratdat = NULL,
  auxdat = NULL,
  gui = FALSE,
  ...
)
```

## Arguments

popType	String. Type of evaluation(s) to include in population data. Note: currently only c('CURR', 'VOL', 'LULC', 'DWM') are available. See details below for descriptions of each.
popTabs	List of population tables the user would like returned. See help(popTables) for a list of options.

popTabIDs	List of unique IDs corresponding to the population tables that the user has requested. See help(popTableIDs) for a list of options.
popFilter	List of population filters. See help(popFilters) for a list of options.
pltassgn	DF/DT, Optional. R object, sf R object, comma-delimited file(.csv), layer or spatial layer in dsn, or shapefile(.shp). Plot-level assignment of estimation unit and/or strata, with one record for each plot.
pltassgnid	String.
dsn	String. Name of database where tree, cond, and plot-level tables reside. The dsn varies by driver. See gdal OGR vector formats ( <a href="https://www.gdal.org/ogr_formats.html">https://www.gdal.org/ogr_formats.html</a> ).
pjoinid	String. Join variable in plot to match pltassgnid. Does not need to be uniqueid. If using most current XY coordinates for plot assignments, use identifier for plot (e.g., PLOT_ID).
areawt	String. Name of variable for summarizing area weights (e.g., CONDPROP_UNADJ).
adj	String. How to calculate adjustment factors for nonsampled (nonresponse) conditions based on summed proportions for by plot ('samp', 'plot'). 'samp' - adjustments are calculated at strata/estimation unit level; 'plot' - adjustments are calculated at plot-level. Adjustments are only calculated for annual inventory plots (DESIGNCD=1).
unitvar	String. Name of the estimation unit variable in unitarea and cond or pltassgn data frame with estimation unit assignment for each plot (e.g., 'ESTN_UNIT'). Optional if only one estimation unit.
unitarea	Numeric or DF. Total area by estimation unit. If only 1 estimation unit, include number of total acreage for the area of interest or a data frame with area and estimation unit. If more than one estimation unit, provide a data frame of total area by estimation unit, including unitvar and areavar.
areavar	String. Name of area variable in unitarea. Default="ACRES".
strata	Logical. If TRUE, include information for post-stratification.
stratalut	DF/DT. If strata=TRUE, look-up table with pixel counts or area by strata or proportion or area ('strwt') by strata (and estimation unit). If 'strwt' is not included, set getwt=TRUE and getwtvar as the name of variable to calculate weights from (e.g., pixel counts).
strvar	String. If strata=TRUE, name of the strata variable in stratalut and cond or pltassgn data frame with stratum assignment for each plot (Default = 'STRATUMCD').
savedata	Logical. If TRUE, saves table(s) to outfolder.
saveobj	Logical. If TRUE, saves returned list object to outfolder.
objnm	String. Name of *.rds object.
unit_opts	List. See help(unit_options()) for a list of options.
strata_opts	List. See help(strata_options()) for a list of options. Only used when strata = TRUE.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE.

GBdata	R List object. Output data list components from FIESTA::anGBdata().
pltdat	R List object. Output data list components from FIESTA::spGetPlots().
stratdat	R List object. Output data list components from FIESTA::spGetStrata().
auxdat	R List object. Output data list components from FIESTA::spGetAuxiliary().
gui	Logical. If gui, user is prompted for parameters.
...	For extensibility.

## Details

### Population types

#### popType Description

ALL	Population data, including nonsampled plots.
CURR	Population data for area estimates, excluding nonsampled plots.
VOL	Population data for area/tree estimates, excluding nonsampled plots.
LULC	Population data for land use/land cover transitional estimates, including only plots with previous m

If variables are NULL, then it will prompt user to input variables.

Necessary variables:

Data	Variable	Description
tree	tuniqueid	Unique identifier for each plot in tree table.
	CONDID	Unique identifier of each condition on plot. Set CONDID=1, if only 1 condition per
	TPA_UNADJ	Number of trees per acre each sample tree represents (e.g., DESIGNCD=1: TPA_U
cond	cuniqueid	Unique identifier for each plot in cond table.
	CONDID	Unique identifier of each condition on plot. Set CONDID=1, if only 1 condition per
	CONDPROP_UNADJ	Unadjusted proportion of condition on each plot. Set CONDPROP_UNADJ=1, if c
	COND_STATUS_CD	Status of each forested condition on plot (i.e. accessible forest, nonforest, water, et
	NF_COND_STATUS_CD	If ACI=TRUE. Status of each nonforest condition on plot (i.e. accessible nonforest
	SITECLCD	If landarea=TIMBERLAND. Measure of site productivity.
	RESERVCD	If landarea=TIMBERLAND. Reserved status.
	SUBPROP_UNADJ	Unadjusted proportion of subplot conditions on each plot. Set SUBPROP_UNADJ
pltassgn	MICRPROP_UNADJ	If microplot tree attributes. Unadjusted proportion of microplot conditions on each
	MACRPROP_UNADJ	If macroplot tree attributes. Unadjusted proportion of macroplot conditions on each
	pltassgnid	Unique identifier for each plot in pltassgn.
	STATECD	Identifies state each plot is located in.
	INVYR	Identifies inventory year of each plot.
	PLOT_STATUS_CD	Status of each plot (i.e. sampled, nonsampled). If not included, all plots are assum

For available reference tables: `sort(unique(FIESTAutils::ref_codes$VARIABLE))`

**Value**

A list with population data for Green-Book estimates.

condx	Data frame. Condition-level data including plot-level assignment of estimation unit and stratum (if strata=TRUE), condition proportion adjustment factor (cadjfac), and adjusted condition proportions (CONDPROP_ADJ).
cuniqueid	String. Unique identifier of plot in condx and pltcondx.
condid	String. Unique identifier of condition in condx and pltcondx.
treex	Data frame. Tree data within population, used for estimation, including trees per acre adjustment factor (tadjfac), and adjusted trees per acre (TPA_ADJ) (if treef is included).
tuniqueid	String. Unique identifier of plot in treex (if treef is included).
ACI.filter	String. If ACI=FALSE, ACI.filter="COND_STATUS_CD == 1".
unitarea	String. Returned table of area by estimation unit.
unitvar	String. Variable name for estimation unit.
strlut	String. Strata-level table with pixel counts by strata (P1POINTCNT), strata weights (strwt), number of plots by strata (n.strata), total number of plots in estimation unit (n.total), sum of condition proportions (_UNADJ_SUM), area adjustments (*_ADJFAC), total area, and area expansion by strata (EXPNS).
strvar	String. Variable name for strata. If strata=FALSE, strvar="ONESTRAT".
expcondtab	String. If ACI=FALSE, ACI.filter="COND_STATUS_CD == 1".
plotsampcnt	Data frame. Number of plots by PLOT_STATUS_CD.
condsampcnt	Data frame. Number of conditions by COND_STATUS_CD.
states	String. State names in dataset.
invyrs	String. Range of inventory years in dataset.
stratdat	Data frame. Strata information by estimation unit.

**Variable****Description**

unitvar	estimation unit
strvar	stratum value
strwtvar	number of pixels by strata and estimation unit
n.strata	number of plots in strata (after totally nonsampled plots removed)
n.total	number of plots for estimation unit
strwt	proportion of area (or plots) by strata and estimation unit (i.e., strata weight)
CONDPROP_UNADJ_SUM	summed conditionproportion by strata and estimation unit
CONDPROP_ADJFAC	adjusted condition proportion by strata after nonsampled plots removed
AREA_USED	total area of estimation unit
expfac	strata-level expansion factor after nonsampled plots and conditions removed (AREA_USED)
EXPNS	strata-level area expansions (expfac * strwt)

Table(s) are also written to outfolder.

**Note****ADJUSTMENT FACTOR:**

The adjustment factor is necessary to account for nonsampled conditions. It is calculated for each estimation unit by strata. by summing the unadjusted proportions of the subplot, microplot, and macroplot (i.e. \*PROP\_UNADJ) and dividing by the number of plots in the strata/estimation unit).

An adjustment factor is determined for each tree based on the size of the plot it was measured on. This is identified using TPA\_UNADJ as follows:

<b>PLOT SIZE</b>	<b>TPA_UNADJ</b>
SUBPLOT	6.018046
MICROPLOT	74.965282
MACROPLOT	0.999188

If ACI=FALSE, only nonsampled forest conditions are accounted for in the adjustment factor.

If ACI=TRUE, the nonsampled nonforest conditions are removed as well and accounted for in adjustment factor. This is if you are interested in estimates for all lands or nonforest lands in the All-Condition-Inventory.

unitcombine:

If TRUE and less than 2 plots in any one estimation unit, all estimation units with 10 or less plots are combined. The current method for combining is to group the estimation unit with less than 10 plots with the estimation unit following in consecutive order (numeric or alphabetical), restrained by survey unit (UNITCD) if included in dataset, and continuing until the number of plots equals 10. If there are no estimation units following in order, it is combined with the estimation unit previous in order.

stratcombine:

If TRUE and less than 2 plots in any one strata class within an estimation unit, all strata classes with 2 or less plots are combined. The current method for combining is to group the strata with less than 2 plots with the strata class following in consecutive order (numeric or alphabetical), restrained by estimation unit (if unitcombine=FALSE), and continuing until the number of plots equals 10. If there are no strata classes following in order, it is combined with the estimation unit previous in order.

  strata_opts = strata_options(getwt = TRUE)
)

str(GBpopdat, max.level = 1)

```

---

 modGBratio

*Green-Book module - Generate ratio estimates.*

---

## Description

Generates per-acre and per-tree estimates by domain and/or tree domain (and estimation unit). Calculations are based on chapter 4 of Scott et al. 2005 ('the green-book') for mapped forest inventory plots. The ratio estimator for estimating per-acre or per-tree by stratum and domain is used, referred to as Ratio of Means (ROM).

## Usage

```

modGBratio(
  GBpopdat,
  estseed = "none",
  ratiotype = "PERACRE",
  landarea = "FOREST",
  pcfilter = NULL,
  estvarn = NULL,
  estvarn.filter = NULL,
  estvard = NULL,
  estvard.filter = NULL,
  rowvar = NULL,
  colvar = NULL,
  sumunits = TRUE,
  returntitle = FALSE,
  savedata = FALSE,
  table_opts = NULL,
  title_opts = NULL,
  savedata_opts = NULL,
  gui = FALSE,
  ...
)

```

**Arguments**

GBpopdat	List. Population data objects returned from modGBpop().
estseed	String. Use seedling data only or add to tree data. Seedling estimates are only for counts (estvar='TPA_UNADJ')-( 'none', 'only', 'add').
ratioype	String. The type of ratio estimates ("PERACRE", "PERTREE").
landarea	String. The sample area filter for estimates ("FOREST", "TIMBERLAND"). If landarea=FOREST, filtered to COND_STATUS_CD = 1; If landarea=TIMBERLAND, filtered to SITECLCD in(1:6) and RESERVCD = 0.
pcfilter	String. A filter for plot or cond attributes (including pltassgn). Must be R logical syntax.
estvarn	String. Name of the tree estimate variable (numerator).
estvarn.filter	String. A tree filter for the estimate variable (numerator). Must be R syntax (e.g., "STATUSCD == 1").
estvard	String. Name of the tree estimate variable (denominator).
estvard.filter	String. A tree filter for the estimate variable (denominator). Must be R syntax (e.g., "STATUSCD == 1").
rowvar	String. Name of the row domain variable in cond or tree. If only one domain, rowvar = domain variable. If more than one domain, include colvar. If no domain, rowvar = NULL.
colvar	String. Name of the column domain variable in cond or tree.
sumunits	Logical. If TRUE, estimation units are summed and returned in one table.
returntitle	Logical. If TRUE, returns title(s) of the estimation table(s).
savedata	Logical. If TRUE, saves table(s) to outfolder.
table_opts	List. See help(table_options()) for a list of options.
title_opts	List. See help(title_options()) for a list of options.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE.
gui	Logical. If gui, user is prompted for parameters.
...	Parameters for modGBpop() if GBpopdat is NULL.

**Details**

If variable = NULL, then it will prompt user for input.

Necessary variables:

Data	Variable	Description
tree	tuniqueid	Unique identifier for each plot, to link to pltassgn (ex. PLT_CN).
	CONDID	Unique identifier of each condition on plot, to link to cond. Set CONDID=1, if only 1 condition per plot.
	TPA_UNADJ	Number of trees per acre each sample tree represents (ex. DESIGNCD=1: TPA_UNADJ).
cond	cuniqueid	Unique identifier for each plot, to link to pltassgn (ex. PLT_CN).
	CONDID	Unique identifier of each condition on plot. Set CONDID=1, if only 1 condition per plot.
	CONDPROP_UNADJ	Unadjusted proportion of condition on each plot. Set CONDPROP_UNADJ=1, if only 1 condition per plot.

	COND_STATUS_CD	Status of each forested condition on plot (i.e. accessible forest, nonforest, water, et
	NF_COND_STATUS_CD	If ACI=TRUE. Status of each nonforest condition on plot (i.e. accessible nonforest
	SITECLCD	If landarea=TIMBERLAND. Measure of site productivity.
	RESERVCD	If landarea=TIMBERLAND. Reserved status.
	SUBPROP_UNADJ	Unadjusted proportion of subplot conditions on each plot. Set SUBPROP_UNADJ
	MICRPROP_UNADJ	If microplot tree attributes. Unadjusted proportion of microplot conditions on each
	MACRPROP_UNADJ	If macroplot tree attributes. Unadjusted proportion of macroplot conditions on each
pltassgn	puniqueid	Unique identifier for each plot, to link to cond (ex. CN).
	STATECD	Identifies state each plot is located in.
	INVYR	Identifies inventory year of each plot.
	PLOT_STATUS_CD	Status of each plot (i.e. sampled, nonsampled). If not included, all plots are assum

For available reference tables: `sort(unique(FIESTAutils::ref_codes$VARIABLE))`

## Value

A list with estimates with percent sampling error for rowvar (and colvar). If sumunits=TRUE or unitvar=NULL and colvar=NULL, one data frame is returned. Otherwise, a list object is returned with the following information. If savedata=TRUE, all data frames are written to outfolder.

est	Data frame. Tree estimates by rowvar, colvar (and estimation unit). If sumunits=TRUE or one estimation unit and colvar=NULL, estimates and percent sampling error are in one data frame.
pse	Data frame. Percent sampling errors (Confidence level 68 colvar (and estimation unit). Note: for 95 percent sampling error by 1.96.
titlelst	List with 1 or 2 string vectors. If returntitle=TRUE a list with table title(s). The list contains one title if est and pse are in the same table and two titles if est and pse are in separate tables.
raw	List of data frames. If rawdata=TRUE, a list including the processing data used for estimation including: number of plots and conditions; stratification information; and 1 to 8 tables with calculated values for table cells and totals (See processing data below).

## Raw data

plotsampcnt	Table. Number of plots by plot status (ex. sampled forest on plot, sampled nonforest, nonsampled).
condsampcnt	DF. Number of conditions by condition status (forest land, nonforest land, non-census water, census water, nonsampled).
unitarea	DF. Area by estimation unit.
expcondtab	DF. Condition-level area expansion factors.
tdomdat	DF. Final data table used for estimation.
stratdat	Data frame. Strata information by estimation unit.

Variable	Description
unitvar	estimation unit
strvar	stratum value
strwtvar	number of pixels by strata and estimation unit
n.strata	number of plots in strata (after totally nonsampled plots removed)
n.total	number of plots for estimation unit
strwt	proportion of area (or plots) by strata and estimation unit (i.e., strata weight)
CONDPROP_UNADJ_SUM	summed condition proportion by strata and estimation unit
CONDPROP_ADJFAC	adjusted condition proportion by strata after nonsampled plots removed

## processing data

Data frames. Separate data frames of variables used in estimation process for the rowvar, colvar and combination of rowvar and colvar (if colvar is not NULL), and grand total by estimation unit (unit.rowest, unit.colest, unit.grpest, unit.totest, respectively) and summed estimation units, if sumunits=TRUE (roweset, colest, grpest, totest, respectively).

The data frames include the following information:

Variable	Description
nhat	estimated proportion of trees for numerator
nhat.var	variance estimate of estimated proportion of trees for numerator
dhat	estimated proportion of trees for denominator
dhat.var	variance estimate of estimated proportion of trees for denominator
covar	covariance for ratio
NBRPLT.gt0	Number of non-zero plots used in estimates
ACRES	total area for estimation unit
estn	estimated area of trees, for numerator $nhat * ACRES$
estn.var	variance estimate of estimated area of trees $nhat.var * areavar^2$
estd	estimated area of land (ratiotype="PERACRE"), for denominator $dhat * areavar$
estd.var	variance of estimated area, for denominator $dhat.var * areavar^2$
estd.covar	estimated covariance of numerator and denominator $covar * areavar^2$
rhat	estimated ratio $estn / estd$
rhat.var	variance estimate of estimation ratio $estn.var + rhat^2 * estd.var - 2 * rhat * estd.covar / estd^2$
rhat.se	estimated standard error of ratio $\sqrt{rhat.var}$
rhat.cv	estimated coefficient of variation of ratio $rhat.se / rhat$
rhat.pse	estimated percent standard error or ratio $rhat.cv * 100$
CI99left	left tail of 99 percent confidence interval for estimated area
CI99right	right tail of 99 percent confidence interval for estimated area
CI95left	left tail of 95 percent confidence interval for estimated area
CI95right	right tail of 95 percent confidence interval for estimated area
CI67left	left tail of 67 percent confidence interval for estimated area
CI67right	right tail of 67 percent confidence interval for estimated area

Table(s) are also written to outfolder.

**Note****ADJUSTMENT FACTOR:**

The adjustment factor is necessary to account for nonsampled conditions. It is calculated for each estimation unit by strata. by summing the unadjusted proportions of the subplot, microplot, and macroplot (i.e. \*PROP\_UNADJ) and dividing by the number of plots in the strata/estimation unit).

An adjustment factor is determined for each tree based on the size of the plot it was measured on. This is identified using TPA\_UNADJ as follows:

<b>PLOT SIZE</b>	<b>TPA_UNADJ</b>
SUBPLOT	6.018046
MICROPLOT	74.965282
MACROPLOT	0.999188

If ACI=FALSE, only nonsampled forest conditions are accounted for in the adjustment factor.

If ACI=TRUE, the nonsampled nonforest conditions are removed as well and accounted for in adjustment factor. This is if you are interested in estimates for all lands or nonforest lands in the All-Condition-Inventory.

**STRATA:**

Stratification is used to reduce variance in population estimates by partitioning the population into homogenous classes (strata), such as forest and nonforest. For stratified sampling methods, the strata sizes (weights) must be either known or estimated. Remotely-sensed data is often used to generate strata weights with proportion of pixels by strata. If stratification is desired (strata=TRUE), the required data include: stratum assignment for the center location of each plot, stored in either pltassgn or cond; and a look-up table with the area or proportion of the total area of each strata value by estimation unit, making sure the name of the strata (and estimation unit) variable and values match the plot assignment name(s) and value(s).

**sumunits:**

An estimation unit is a population, or area of interest, with known area and number of plots. Individual counties or combined Super-counties are common estimation units for FIA. An estimation unit may also be a subpopulation of a larger population (e.g., Counties within a State). Subpopulations are mutually exclusive and independent within a population, therefore estimated totals and variances are additive. For example, State-level estimates are generated by summing estimates from all subpopulations within the State (Bechtold and Patterson. 2005. Chapter 2). Each plot must be assigned to only one estimation unit.

If sumunits=TRUE, estimates are generated by estimation unit, summed together, and returned as one estimate. If rawdata=TRUE, estimates by individual estimation unit are also returned.

If sumunits=FALSE, estimates are generated and returned by estimation unit as one data frame. If savedata=TRUE, a separate file is written for each estimation unit.

**stratcombine:**

If TRUE and less than 2 plots in any one estimation unit, all estimation units with 10 or less plots are combined. The current method for combining is to group the estimation unit with less than 10 plots with the estimation unit following in consecutive order (numeric or alphabetical), restrained by survey unit (UNITCD) if included in dataset, and continuing until the number of plots equals 10. If there are no estimation units following in order, it is combined with the estimation unit previous in order.

**rowlut/collut:**

There are several objectives for including rowlut/collut look-up tables: 1) to include descriptive names that match row/column codes in the input table; 2) to use number codes that match row/column names in the input table for ordering rows; 3) to add rows and/or columns with 0 values for consistency. No duplicate names are allowed.

**Include 2 columns in the table:**

1-the merging variable with same name as the variable in the input merge table;

2-the ordering or descriptive variable.

If the ordering variable is the rowvar/colvar in the input table and the descriptive variable is in rowlut/collut, set row.orderby/col.orderby equal to rowvar/colvar. If the descriptive variable is the rowvar/colvar in the input table, and the ordering code variable is in rowlut/collut, set row.orderby/col.orderby equal to the variable name of the code variable in rowlut/collut.

**UNITS:**

The following variables are converted from pounds (in NIMS) to short tons by multiplying the variable by 0.0005. DRYBIO\_AG, DRYBIO\_BG, DRYBIO\_WDLD\_SPP, DRYBIO\_SAPLING, DRYBIO\_STUMP, DRYBIO\_TOP, DRYBIO\_BOLE, DRYBIOT, DRYBIOM, DRYBIOTB, JBIOTOT, CARBON\_BG, CARBON\_AG

**MORTALITY:**

For Interior-West FIA, mortality estimates are mainly based on whether a tree has died within the last 5 years of when the plot was measured. If a plot was remeasured, mortality includes trees that were alive the previous visit but were dead in the next visit. If a tree was standing the previous visit, but was not standing in the next visit, no diameter was collected (DIA = NA) but the tree is defined as mortality.

**Common tree filters:**

<b>FILTER</b>	<b>DESCRIPTION</b>
"STATUSCD == 1"	Live trees
"STATUSCD == 2"	Dead trees
"TPAMORT_UNADJ > 0"	Mortality trees
"STATUSCD == 2 & DIA >= 5.0"	Dead trees >= 5.0 inches diameter
"STATUSCD == 2 & AGENTCD == 30"	Dead trees from fire

---

modGBtree

*Green-Book module - Generate tree estimates.*

---

## Description

Generates tree and or seedling estimates by domain and/or tree domain (and estimation unit). Calculations are based on Scott et al. 2005 ('the green-book') for mapped forest inventory plots. The non-ratio estimator for estimating tree attributes by stratum and domain is used. Plots that are totally nonsampled are excluded from estimation dataset. Next, an adjustment factor is calculated by strata to adjust for nonsampled (nonresponse) conditions that have proportion less than 1. Attributes adjusted to a per-acre value are summed by plot, divided by the adjustment factor, and averaged by stratum. Strata means are combined using the strata weights and then expanded to using the total land area in the population.

**Usage**

```

modGBtree(
  GBpopdat,
  estvar,
  estvar.filter = NULL,
  estseed = "none",
  landarea = "FOREST",
  pcfilter = NULL,
  rowvar = NULL,
  colvar = NULL,
  sumunits = TRUE,
  returntitle = FALSE,
  savedata = FALSE,
  table_opts = NULL,
  title_opts = NULL,
  savedata_opts = NULL,
  gui = FALSE,
  ...
)

```

**Arguments**

GBpopdat	List. Population data objects returned from FIESTA::modGBpop().
estvar	String. Name of the tree-level estimate variable (e.g., 'VOLCFNET').
estvar.filter	String. A tree-level filter for estvar. Must be R syntax (e.g., 'STATUSCD == 1').
estseed	String. Use seedling data only or add to tree data. Seedling estimates are only for counts (estvar='TPA_UNADJ')-( 'none', 'only', 'add').
landarea	String. The condition-level filter for defining land area ('ALL', 'FOREST', 'TIMBERLAND'). If landarea='FOREST', COND_STATUS_CD = 1; if landarea='TIMBERLAND', SITECLCD in(1:6) & RESERVCD = 0.
pcfilter	String. A filter for plot or cond attributes (including pltassgn). Must be R logical syntax.
rowvar	String. Optional. Name of domain variable to group estvar by for rows in table output. Rowvar must be included in an input data frame (i.e., plt, cond, tree). If no rowvar is included, an estimate is returned for the total estimation unit. Include colvar for grouping by 2 variables.
colvar	String. Optional. If rowvar != NULL, name of domain variable to group estvar by for columns in table output. Colvar must be included in an input data frame (i.e., plt, cond, tree).
sumunits	Logical. If TRUE, estimation units are summed and returned in one table.
returntitle	Logical. If TRUE, returns title(s) of the estimation table(s).
savedata	Logical. If TRUE, saves table(s) to outfolder.
table_opts	List. See help(table_options()) for a list of options.
title_opts	List. See help(title_options()) for a list of options.

savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE.
gui	Logical. If gui, user is prompted for parameters.
...	Parameters for modGBpop() if GBpopdat is NULL.

### Details

If variables are NULL, then it will prompt user to input variables.

Necessary variables:

Data	Variable	Description
tree	tuniqueid	Unique identifier for each plot, to link to pltassgn (ex. PLT_CN).
	CONDID	Unique identifier of each condition on plot, to link to cond. Set CONDID=1, if only 1 condition per plot.
	TPA_UNADJ	Number of trees per acre each sample tree represents (ex. DESIGNCD=1: TPA_UNADJ=1).
cond	cuniqueid	Unique identifier for each plot, to link to pltassgn (ex. PLT_CN).
	CONDID	Unique identifier of each condition on plot. Set CONDID=1, if only 1 condition per plot.
	CONDPROP_UNADJ	Unadjusted proportion of condition on each plot. Set CONDPROP_UNADJ=1, if only 1 condition per plot.
	COND_STATUS_CD	Status of each forested condition on plot (i.e. accessible forest, nonforest, water, etc).
	NF_COND_STATUS_CD	If ACI=TRUE. Status of each nonforest condition on plot (i.e. accessible nonforest, etc).
	SITECLCD	If landarea=TIMBERLAND. Measure of site productivity.
	RESERVCD	If landarea=TIMBERLAND. Reserved status.
pltassgn	SUBPROP_UNADJ	Unadjusted proportion of subplot conditions on each plot. Set SUBPROP_UNADJ=1, if only 1 subplot condition per plot.
	MICRPROP_UNADJ	If microplot tree attributes. Unadjusted proportion of microplot conditions on each plot.
	MACRPROP_UNADJ	If macroplot tree attributes. Unadjusted proportion of macroplot conditions on each plot.
	puniqueid	Unique identifier for each plot, to link to cond (ex. CN).
STATECD	STATECD	Identifies state each plot is located in.
	INVYR	Identifies inventory year of each plot.
	PLOT_STATUS_CD	Status of each plot (i.e. sampled, nonsampled). If not included, all plots are assumed sampled.

For available reference tables: sort(unique(FIESTAutils::ref\_codes\$VARIABLE))

### Value

A list with estimates with percent sampling error for rowvar (and colvar). If sumunits=TRUE or unitvar=NULL and colvar=NULL, one data frame is returned. Otherwise, a list object is returned with the following information. If savedata=TRUE, all data frames are written to outfolder.

est	Data frame. Tree estimates by rowvar, colvar (and estimation unit). If sumunits=TRUE or one estimation unit and colvar=NULL, estimates and percent sampling error are in one data frame.
pse	Data frame. Percent sampling errors (Confidence level 68 colvar (and estimation unit). Note: for 95 percent sampling error by 1.96.
titlelst	List with 1 or 2 string vectors. If returntitle=TRUE a list with table title(s). The list contains one title if est and pse are in the same table and two titles if est and pse are in separate tables.

raw List of data frames. If rawdata=TRUE, a list including the processing data used for estimation including: number of plots and conditions; stratification information; and 1 to 8 tables with calculated values for table cells and totals (See processing data below).

#### Raw data

plotsampcnt Table. Number of plots by plot status (ex. sampled forest on plot, sampled nonforest, nonsampled).

condsampcnt DF. Number of conditions by condition status (forest land, nonforest land, non-census water, census water, nonsampled).

unitarea DF. Area by estimation unit.

expcondtab DF. Condition-level area expansion factors.

tdomdat DF. Final data table used for estimation.

stratdat Data frame. Strata information by estimation unit.

Variable	Description
unitvar	estimation unit
strvar	stratum value
strwtvar	number of pixels by strata and estimation unit
n.strata	number of plots in strata (after totally nonsampled plots removed)
n.total	number of plots for estimation unit
strwt	proportion of area (or plots) by strata and estimation unit (i.e., strata weight)
CONDPROP_UNADJ_SUM	summed condition proportion by strata and estimation unit
CONDPROP_ADJFAC	adjusted condition proportion by strata after nonsampled plots removed

#### processing data

Data frames. Separate data frames containing calculated variables used in estimation process. The number of processing tables depends on the input parameters. The tables include: total by estimation unit (unit.totest); rowvar totals (unit.rowest), and if colvar is not NULL, colvar totals, (unit.colvar); and a combination of rowvar and colvar (unit.grpvar). If sumunits=TRUE, the raw data for the summed estimation units are also included (totest, rowest, colest, grp est, respectively). These tables do not included estimate proportions (nhat and nhat.var).

The data frames include the following information:

Variable	Description
nhat	estimated proportion of trees
nhat.var	variance estimate of estimated proportion of trees
NBRPLT.gt0	Number of non-zero plots used in estimates
ACRES	total area for estimation unit
est	estimated area of trees nhat*ACRES
est.var	variance estimate of estimated area of trees nhat.var*areavar^2
est.se	standard error of estimated area of trees sqrt(est.var)
est.cv	coefficient of variation of estimated area of trees est.se/est

pse	percent sampling error of estimate est.cv*100
CI99left	left tail of 99 percent confidence interval for estimated area
CI99right	right tail of 99 percent confidence interval for estimated area
CI95left	left tail of 95 percent confidence interval for estimated area
CI95right	right tail of 95 percent confidence interval for estimated area
CI67left	left tail of 67 percent confidence interval for estimated area
CI67right	right tail of 67 percent confidence interval for estimated area

Table(s) are also written to outfolder.

### Note

#### ADJUSTMENT FACTOR:

The adjustment factor is necessary to account for nonsampled conditions. It is calculated for each estimation unit by strata. by summing the unadjusted proportions of the subplot, microplot, and macroplot (i.e. \*PROP\_UNADJ) and dividing by the number of plots in the strata/estimation unit).

An adjustment factor is determined for each tree based on the size of the plot it was measured on. This is identified using TPA\_UNADJ as follows:

PLOT SIZE	TPA_UNADJ
SUBPLOT	6.018046
MICROPLOT	74.965282
MACROPLOT	0.999188

If ACI=FALSE, only nonsampled forest conditions are accounted for in the adjustment factor.

If ACI=TRUE, the nonsampled nonforest conditions are removed as well and accounted for in adjustment factor. This is if you are interested in estimates for all lands or nonforest lands in the All-Condition-Inventory.

#### sumunits:

An estimation unit is a population, or area of interest, with known area and number of plots. Individual counties or combined Super-counties are common estimation units for FIA. An estimation unit may also be a subpopulation of a larger population (e.g., Counties within a State). Subpopulations are mutually exclusive and independent within a population, therefore estimated totals and variances are additive. For example, State-level estimates are generated by summing estimates from all subpopulations within the State (Bechtold and Patterson. 2005. Chapter 2). Each plot must be assigned to only one estimation unit.

If sumunits=TRUE, estimates are generated by estimation unit, summed together, and returned as one estimate. If rawdata=TRUE, estimates by individual estimation unit are also returned.

If sumunits=FALSE, estimates are generated and returned by estimation unit as one data frame. If savedata=TRUE, a separate file is written for each estimation unit.

#### stratcombine:

If TRUE and less than 2 plots in any one estimation unit, all estimation units with 10 or less plots are combined. The current method for combining is to group the estimation unit with less than 10 plots with the estimation unit following in consecutive order (numeric or alphabetical), restrained by survey unit (UNITCD) if included in dataset, and continuing until the number of plots equals 10.

If there are no estimation units following in order, it is combined with the estimation unit previous in order.

rowlut/collut:

There are several objectives for including rowlut/collut look-up tables: 1) to include descriptive names that match row/column codes in the input table; 2) to use number codes that match row/column names in the input table for ordering rows; 3) to add rows and/or columns with 0 values for consistency. No duplicate names are allowed.

Include 2 columns in the table:

- 1-the merging variable with same name as the variable in the input merge table;
- 2-the ordering or descriptive variable.

If the ordering variable is the rowvar/colvar in the input table and the descriptive variable is in rowlut/collut, set row.orderby/col.orderby equal to rowvar/colvar. If the descriptive variable is the rowvar/colvar in the input table, and the ordering code variable is in rowlut/collut, set row.orderby/col.orderby equal to the variable name of the code variable in rowlut/collut.

UNITS:

The following variables are converted from pounds (from FIA database) to short tons by multiplying the variable by 0.0005. DRYBIO\_AG, DRYBIO\_BG, DRYBIO\_WDLT\_SPP, DRYBIO\_SAPLING, DRYBIO\_STUMP, DRYBIO\_TOP, DRYBIO\_BOLE, DRYBIOT, DRYBIOM, DRYBIOTB, JBIOTOT, CARBON\_BG, CARBON\_AG

MORTALITY:

For Interior-West FIA, mortality estimates are mainly based on whether a tree has died within the last 5 years of when the plot was measured. If a plot was remeasured, mortality includes trees that were alive the previous visit but were dead in the next visit. If a tree was standing the previous visit, but was not standing in the next visit, no diameter was collected (DIA = NA) but the tree is defined as mortality.

Common tree filters:

<b>FILTER</b>	<b>DESCRIPTION</b>
"STATUSCD == 1"	Live trees
"STATUSCD == 2"	Dead trees
"TPAMORT_UNADJ > 0"	Mortality trees
"STATUSCD == 2 & DIA >= 5.0"	Dead trees >= 5.0 inches diameter
"STATUSCD == 2 & AGENTCD == 30"	Dead trees from fire

---

modMAarea

*Model-Assisted module - Generate model-assisted area estimates.*

---

**Description**

Generates area estimates by estimation unit. Estimates are calculated from McConville et al. (2018)'s mase R package.

**Usage**

```

modMAarea(
  MApopdat,

```

```

MAMethod,
FIA = TRUE,
prednames = NULL,
modelselect = FALSE,
landarea = "FOREST",
pcfilter = NULL,
rowvar = NULL,
colvar = NULL,
bootstrap = FALSE,
returntitle = FALSE,
savedata = FALSE,
table_opts = NULL,
title_opts = NULL,
savedata_opts = NULL,
gui = FALSE,
...
)

```

### Arguments

MApopdat	List. Population data objects returned from modMApop().
MAMethod	String. mase (i.e., model-assisted) method to use ('greg', 'gregEN', 'ratio').
FIA	Logical. If TRUE, the finite population term is removed from estimator to match FIA estimates.
prednames	String vector. Name(s) of predictor variables to include in model.
modelselect	Boolean. TRUE if you want model selection to occur.
landarea	String. The sample area filter for estimates ('ALL', 'FOREST', 'TIMBERLAND'). If landarea=FOREST, filtered to COND_STATUS_CD = 1; If landarea=TIMBERLAND, filtered to SITECLCD in(1:6) and RESERVCD = 0.
pcfilter	String. A filter for plot or cond attributes (including pltassgn). Must be R logical syntax.
rowvar	String. Name of the row domain variable in cond or tree. If only one domain, rowvar = domain variable. If more than one domain, include colvar. If no domain, rowvar = NULL.
colvar	String. Name of the column domain variable in cond or tree.
bootstrap	Logical. If TRUE, returns bootstrap variance estimates, otherwise uses Horvitz-Thompson estimator under simple random sampling without replacement.
returntitle	Logical. If TRUE, returns title(s) of the estimation table(s).
savedata	Logical. If TRUE, saves table(s) to outfolder.
table_opts	List. See help(table_options()) for a list of options.
title_opts	List. See help(title_options()) for a list of options.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE.
gui	Logical. If gui, user is prompted for parameters.
...	Parameters for modMApop() if MApopdat is NULL.

## Details

If variables are NULL, then it will prompt user to input variables.

Necessary variables:

Data	Variable	Description
tree	tuniqueid	Unique identifier for each plot, to link to pltstrat (ex. PLT_CN).
	CONDID	Unique identifier of each condition on plot, to link to cond. Set CONDID=1, if only 1 condition per plot.
cond	cuniqueid	Unique identifier for each plot, to link to pltstrat (ex. PLT_CN).
	CONDID	Unique identifier of each condition on plot. Set CONDID=1, if only 1 condition per plot.
	CONDPROP_UNADJ	Unadjusted proportion of condition on each plot. Set CONDPROP_UNADJ=1, if only 1 condition per plot.
	COND_STATUS_CD	Status of each forested condition on plot (i.e. accessible forest, nonforest, water, etc).
	NF_COND_STATUS_CD	If ACI=TRUE. Status of each nonforest condition on plot (i.e. accessible nonforest, nonaccessible nonforest, etc).
pltstrat	SITECLCD	If landarea=TIMBERLAND. Measure of site productivity.
	RESERVCD	If landarea=TIMBERLAND. Reserved status.
	puniqueid	Unique identifier for each plot, to link to cond (ex. CN).
	STATECD	Identifies state each plot is located in.
	INVYR	Identifies inventory year of each plot.
	PLOT_STATUS_CD	Status of each plot (i.e. sampled, nonsampled). If not included, all plots are assumed sampled.

Reference names are available for the following variables:

ADFORCD, AGENTCD, CCLCD, DECAYCD, DSTRBCD, KINDCD, OWNCD, OWNGRPCD, FORTYPCD, FLDTYPCD, FORTYPCDCALC, TYPGRPCD, FORINDCD, RESERVCD, LANDCLCD, STDSZCD, FLDSZCD, PHYSCLCD, MIST\_CL\_CD, PLOT\_STATUS\_CD, STATECD, TREECLCD, TRTCD, SPCD, SPGRPCD

## Value

If FIA=TRUE or unitvar=NULL and colvar=NULL, one data frame is returned with tree estimates and percent sample errors. Otherwise, a list is returned with tree estimates in one data frame (est) and percent sample errors in another data frame (est.pse). If rawdata=TRUE, another list is returned including raw data used in the estimation process. If addtitle=TRUE and returntitle=TRUE, the title for est/pse is returned. If savedata=TRUE, all data frames are written to outfolder.

est	Data frame. Tree estimates by rowvar, colvar (and estimation unit). If FIA=TRUE or one estimation unit and colvar=NULL, estimates and percent sampling error are in one data frame.
pse	Data frame. Percent sampling errors for estimates by rowvar and colvar (and estimation unit).
titlelst	List with 1 or 2 string vectors. If returntitle=TRUE a list with table title(s). The list contains one title if est and pse are in the same table and two titles if est and pse are in separate tables.
raw	List of data frames. If rawdata=TRUE, a list including: number of plots by plot status, if in dataset (plotsampcnt); number of conditions by condition status (condsampcnt); data used for post-stratification (stratdat); and 1-8 tables with calculated variables used for processing estimates and percent sampling error for table cell values and totals (See processing data below).

Raw data

plotsampcnt	Table. Number of plots by plot status (ex. sampled forest on plot, sampled nonforest, nonsampled).
condsampcnt	DF. Number of conditions by condition status (forest land, nonforest land, non-census water, census water, nonsampled).
stratdat	Data frame. Strata information by estimation unit.

<b>Variable</b>	<b>Description</b>
ESTUNIT	estimation unit
STRATA	strata
ACRES	area by strata for estimation unit
n.strata	number of plots in strata (and estimation unit)
n.total	number of plots for estimation unit
TOTACRES	total area for estimation unit
strwt	proportion of area (or number of plots) by strata (strata weight)
expfac.strata	expansion factor (in area unit (e.g., acres) by strata (areavar/n.strata)

processing data

Data frames. Separate data frames containing calculated variables used in estimation process. The number of processing tables depends on the input parameters. The tables include: total by estimation unit (unit.totest); rowvar totals (unit.rowest), and if colvar is not NULL, colvar totals, (unit.colvar); and a combination of rowvar and colvar (unit.grpvar). If FIA=TRUE, the raw data for the summed estimation units are also included (totest, rowest, colest, grpest, respectively). These tables do not included estimate proportions (nhat and nhat.var).

The data frames include the following information:

<b>Variable</b>	<b>Description</b>
nhat	estimated proportion of trees
nhat.var	estimated variance of estimated proportion of trees
ACRES	total area for estimation unit
est	estimated area of trees $nhat * ACRES$
est.var	estimated variance of estimated area of trees $nhat.var * areavar^2$
est.se	standard error of estimated area of trees $\sqrt{est.var}$
est.cv	coefficient of variation of estimated area of trees $est.se/est$
pse	percent sampling error of estimate $est.cv * 100$
CI99left	left tail of 99 percent confidence interval for estimated area
CI99right	right tail of 99 percent confidence interval for estimated area
CI95left	left tail of 95 percent confidence interval for estimated area
CI95right	right tail of 95 percent confidence interval for estimated area
CI67left	left tail of 67 percent confidence interval for estimated area
CI67right	right tail of 67 percent confidence interval for estimated area

Table(s) are also written to outfolder.

**Note****ADJUSTMENT FACTOR:**

The adjustment factor is necessary to account for nonsampled conditions. It is calculated for each estimation unit by strata. by summing the unadjusted proportions of the subplot, microplot, and macroplot (i.e. \*PROP\_UNADJ) and dividing by the number of plots in the strata/estimation unit).

An adjustment factor is determined for each tree based on the size of the plot it was measured on. This is identified using TPA\_UNADJ as follows:

<b>PLOT SIZE</b>	<b>TPA_UNADJ</b>
SUBPLOT	6.018046
MICROPLOT	74.965282
MACROPLOT	0.999188

If ACI=FALSE, only nonsampled forest conditions are accounted for in the adjustment factor.

If ACI=TRUE, the nonsampled nonforest conditions are removed as well and accounted for in adjustment factor. This is if you are interested in estimates for all lands or nonforest lands in the All-Condition-Inventory.

**stratcombine:**

If MAMethod='PS', and stratcombine=TRUE, and less than 2 plots in any one estimation unit, all estimation units with 10 or less plots are combined. The current method for combining is to group the estimation unit with less than 10 plots with the estimation unit following in consecutive order (numeric or alphabetical), restrained by survey unit (UNITCD) if included in dataset, and continuing until the number of plots equals 10. If there are no estimation units following in order, it is combined with the estimation unit previous in order.

**autoxreduce:**

If MAMethod='GREG', and autoxreduce=TRUE, and there is an error because of multicollinearity, a variable reduction method is applied to remove correlated variables. The method used is based on the variance-inflation factor (vif) from a linear model. The vif estimates how much the variance of each x variable is inflated due to mulitcolinearity in the model.

**rowlut/collut:**

There are several objectives for including rowlut/collut look-up tables: 1) to include descriptive names that match row/column codes in the input table; 2) to use number codes that match row/column names in the input table for ordering rows; 3) to add rows and/or columns with 0 values for consistency. No duplicate names are allowed.

**Include 2 columns in the table:**

1-the merging variable with same name as the variable in the input merge table;

2-the ordering or descriptive variable.

If the ordering variable is the rowvar/colvar in the input table and the descriptive variable is in rowlut/collut, set row.orderby/col.orderby equal to rowvar/colvar. If the descriptive variable is the rowvar/colvar in the input table, and the ordering code variable is in rowlut/collut, set row.orderby/col.orderby equal to the variable name of the code variable in rowlut/collut.

**UNITS:**

The following variables are converted from pounds (from FIA database) to short tons by multiplying the variable by 0.0005. DRYBIO\_AG, DRYBIO\_BG, DRYBIO\_WDLD\_SPP, DRYBIO\_SAPLING,

DRYBIO\_STUMP, DRYBIO\_TOP, DRYBIO\_BOLE, DRYBIOT, DRYBIOM, DRYBIOTB, JBIOTOT, CARBON\_BG, CARBON\_AG

#### MORTALITY:

For Interior-West FIA, mortality estimates are mainly based on whether a tree has died within the last 5 years of when the plot was measured. If a plot was remeasured, mortality includes trees that were alive the previous visit but were dead in the next visit. If a tree was standing the previous visit, but was not standing in the next visit, no diameter was collected (DIA = NA) but the tree is defined as mortality.

Common tree filters:

<b>FILTER</b>	<b>DESCRIPTION</b>
"STATUSCD == 1"	Live trees
"STATUSCD == 2"	Dead trees
"TPAMORT_UNADJ > 0"	Mortality trees
"STATUSCD == 2 & DIA >= 5.0"	Dead trees >= 5.0 inches diameter
"STATUSCD == 2 & AGENTCD == 30"	Dead trees from fire

#### Examples

```
# Set up population dataset (see ?modMApop() for more information)
MApopdat <- modMApop(popTabs = list(tree = FIESTA::WYtree,
                                   cond = FIESTA::WYcond),
                    pltassgn = FIESTA::WYpltassgn,
                    pltassgnid = "CN",
                    unitarea = FIESTA::WYunitarea,
                    unitvar = "ESTN_UNIT",
                    unitzonal = FIESTA::WYunitzonal,
                    prednames = c("dem", "tcc", "tpi", "tnt"),
                    predfac = "tnt")

# Use GREG estimator to estimate area of forest land in our population
modMAarea(MApopdat = MApopdat,
          MAMethod = "greg",
          landarea = "FOREST")

# Use GREG estimator to estimate area of forest land by forest type and
# stand-size class
modMAarea(MApopdat = MApopdat,
```

```

MAMethod = "greg",
landarea = "FOREST",
rowvar = "FORTYPCD",
colvar = "STDSZCD")

```

---

modMApop

---

*Model-Assisted module - Generate population data for MA module.*

---

### Description

Generates population data for generating model-assisted estimation. Plots that are totally nonsampled are excluded from estimation dataset. Next, an adjustment factor is calculated by strata (if MAMethod="PS") or by estimation unit to adjust for nonsampled (nonresponse) conditions that have proportion less than 1. Attributes adjusted to a per-acre value are summed by plot, divided by the adjustment factor, and averaged by stratum and/or estimation unit. Note: population data must be generated by MA method.

### Usage

```

modMApop(
  popType = "VOL",
  popTabs = popTables(),
  popTabIDs = popTableIDs(),
  popFilter = popFilters(),
  pltassgn = NULL,
  pltassgnid = "PLT_CN",
  dsn = NULL,
  pjoinid = "CN",
  areawt = "CONDPROP_UNADJ",
  adjplot = TRUE,
  unitvar = NULL,
  unitarea = NULL,
  areavar = "ACRES",
  unitzonal = NULL,
  prednames = NULL,
  predfac = NULL,
  standardize = TRUE,
  savedata = FALSE,
  saveobj = FALSE,
  objnm = "MApopdat",
  unit_opts = NULL,
  savedata_opts = NULL,
  MAdat = NULL,
  pltdat = NULL,
  auxdat = NULL,
  gui = FALSE,
  ...
)

```

**Arguments**

popType	String. Type of evaluation(s) to include in population data. Note: currently only c('CURR', 'VOL', 'LULC') are available. See details below for descriptions of each.
popTabs	List of population tables the user would like returned. See help(popTables) for a list of options.
popTabIDs	List of unique IDs corresponding to the population tables that the user has requested. See help(popTableIDs) for a list of options.
popFilter	List of population filters. See help(popFilters) for a list of options.
pltassgn	DF/DT, Optional. R object, sf R object, comma-delimited file(.csv), layer or spatial layer in dsn, or shapefile(.shp). Plot-level assignment of estimation unit and/or strata, with one record for each plot.
pltassgnid	String.
dsn	String. Name of database where tree, cond, and plot-level tables reside. The dsn varies by driver. See gdal OGR vector formats ( <a href="https://www.gdal.org/ogr_formats.html">https://www.gdal.org/ogr_formats.html</a> ).
pjoinid	String. Join variable in plot to match pltassgnid. Does not need to be uniqueid. If using most current XY coordinates for plot assignments, use identifier for plot (e.g., PLOT_ID).
areawt	String. Name of variable for summarizing area weights (e.g., CONDPROP_UNADJ).
adjplot	Logical. If TRUE, adjusts for nonresponse at plot-level.
unitvar	String. Name of the estimation unit variable in unitarea and cond or pltassgn data frame with estimation unit assignment for each plot (e.g., 'ESTN_UNIT'). Optional if only one estimation unit.
unitarea	Numeric or DF. Total area by estimation unit. If only 1 estimation unit, include number of total acreage for the area of interest or a data frame with area and estimation unit. If more than one estimation unit, provide a data frame of total area by estimation unit, including unitvar and areavar.
areavar	String. Name of area variable in unitarea. Default="ACRES".
unitzonal	DF/DT. Table with zonal auxiliary information by estimation unit. For continuous data, means by estimation unit; for categorical data, proportion of class by estimation unit.
prednames	String vector. Name(s) of predictor variables to include in model.
predfac	String vector. Name(s) of prednames that are factors (i.e., categorical). Names will change in output depending on number of categories.
standardize	Logical. If TRUE, predictors are standardized.
savedata	Logical. If TRUE, saves table(s) to outfolder.
saveobj	Logical. If TRUE, saves returned list object to outfolder.
objnm	String. Name of *.rds object.
unit_opts	List. See help(unit_options()) for a list of options.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE.

MAdat	List. Data output from FIESTA::MAdat().
pltdat	R List object. Output data list components from FIESTA::spGetPlots().
auxdat	List. Auxiliary data output from FIESTA::spGetAuxiliary().
gui	Logical. If gui, user is prompted for parameters.
...	For extensibility.

### Details

If variables are NULL, then it will prompt user to input variables.

Necessary variables:

Data	Variable	Description
tree	tuniqueid	Unique identifier for each plot, to link to pltassgn (e.g. PLT_CN).
	CONDID	Unique identifier of each condition on plot, to link to cond. Set CONDID=1, if only 1 condition per plot.
cond	TPA_UNADJ	Number of trees per acre each sample tree represents (e.g. DESIGNCD=1: TPA_UNADJ).
	cuniqueid	Unique identifier for each plot, to link to pltassgn (e.g. PLT_CN).
	CONDID	Unique identifier of each condition on plot. Set CONDID=1, if only 1 condition per plot.
	CONDPROP_UNADJ	Unadjusted proportion of condition on each plot. Set CONDPROP_UNADJ=1, if only 1 condition per plot.
	COND_STATUS_CD	Status of each forested condition on plot (i.e. accessible forest, nonforest, water, etc).
	NF_COND_STATUS_CD	If ACI=TRUE. Status of each nonforest condition on plot (i.e. accessible nonforest, etc).
	SITECLCD	If landarea=TIMBERLAND. Measure of site productivity.
pltassgn	RESERVCD	If landarea=TIMBERLAND. Reserved status.
	SUBPROP_UNADJ	Unadjusted proportion of subplot conditions on each plot. Set SUBPROP_UNADJ=1, if only 1 subplot condition per plot.
	MICRPROP_UNADJ	If microplot tree attributes. Unadjusted proportion of microplot conditions on each plot.
	MACRPROP_UNADJ	If macroplot tree attributes. Unadjusted proportion of macroplot conditions on each plot.
	puniqueid	Unique identifier for each plot, to link to cond (e.g. CN).
STATECD	STATECD	Identifies state each plot is located in.
	INVYR	Identifies inventory year of each plot.
	PLOT_STATUS_CD	Status of each plot (i.e. sampled, nonsampled). If not included, all plots are assumed sampled.

For available reference tables: `sort(unique(FIESTAutils::ref_codes$VARIABLE))`

### Value

A list with population data for Green-Book estimates.

condx	Data frame. Condition-level data including plot-level assignment of estimation unit and stratum (if strata=TRUE) and adjusted condition proportion.
pltcondx	Data frame. Condition-level data, merged with plot data.
cuniqueid	String. Unique identifier of plot in condx and pltcondx.
condid	String. Unique identifier of condition in condx and pltcondx.
treex	Data frame. If esttype='TREE', tree-level data, including sample adjustment factor.

tuniqueid	String. If esttype='TREE', unique identifier of plot in treex.
ACI.filter	String. If ACI=FALSE, ACI.filter="COND_STATUS_CD == 1" .
unitarea	String. Returned table of area by estimation unit.
unitvar	String. Variable name for estimation unit.
expcondtab	String. If ACI=FALSE, ACI.filter="COND_STATUS_CD == 1".
plotsampcnt	Data frame. Number of plots by PLOT_STATUS_CD.
condsampcnt	Data frame. Number of conditions by COND_STATUS_CD.
states	String. State names in dataset.
invyrs	String. Range of inventory years in dataset.

<b>Variable</b>	<b>Description</b>
unitvar	estimation unit
n.total	number of plots for estimation unit
CONDPROP_UNADJ_SUM	summed condition proportion by strata and estimation unit
CONDPROP_ADJFAC	adjusted condition proportion by strata after nonsampled plots removed
AREA_USED	total area of estimation unit
expfac	strata-level expansion factor after nonsampled plots and conditions removed (AREA_USED)
EXPNS	strata-level area expansions (expfac * strwt)

Table(s) are also written to outfolder.

**Note**

**ADJUSTMENT FACTOR:**

The adjustment factor is necessary to account for nonsampled conditions. It is calculated for each estimation unit by strata. by summing the unadjusted proportions of the subplot, microplot, and macroplot (i.e. \*PROP\_UNADJ) and dividing by the number of plots in the strata/estimation unit).

An adjustment factor is determined for each tree based on the size of the plot it was measured on. This is identified using TPA\_UNADJ as follows:

<b>PLOT SIZE</b>	<b>TPA_UNADJ</b>
SUBPLOT	6.018046
MICROPLOT	74.965282
MACROPLOT	0.999188

If ACI=FALSE, only nonsampled forest conditions are accounted for in the adjustment factor.

If ACI=TRUE, the nonsampled nonforest conditions are removed as well and accounted for in adjustment factor. This is if you are interested in estimates for all lands or nonforest lands in the All-Condition-Inventory.

**unitcombine:**

If TRUE and less than 2 plots in any one estimation unit, all estimation units with 10 or less plots are combined. The current method for combining is to group the estimation unit with less than 10

plots with the estimation unit following in consecutive order (numeric or alphabetical), restrained by survey unit (UNITCD) if included in dataset, and continuing until the number of plots equals 10. If there are no estimation units following in order, it is combined with the estimation unit previous in order.

stratcombine:

If TRUE and less than 2 plots in any one strata class within an estimation unit, all strata classes with 2 or less plots are combined. The current method for combining is to group the strata with less than 2 plots with the strata class following in consecutive order (numeric or alphabetical), restrained by estimation unit (if unitcombine=FALSE), and continuing until the number of plots equals 10. If there are no strata classes following in order, it is combined with the estimation unit previous in order.

modMAtree

---

*Model-Assisted module - Generate model-assisted tree estimates.*

---

## Description

Generates tree estimates by estimation unit. Estimates are calculated from McConville et al. (2018)'s mase R package.

## Usage

```
modMAtree(
  MApopdat,
  MAMethod,
  estvar,
  estvar.filter = NULL,
  estseed = "none",
  landarea = "FOREST",
  pcfilter = NULL,
  rowvar = NULL,
  colvar = NULL,
  prednames = NULL,
  modelselect = FALSE,
  FIA = TRUE,
  bootstrap = FALSE,
  returntitle = FALSE,
  savedata = FALSE,
  table_opts = NULL,
  title_opts = NULL,
  savedata_opts = NULL,
  gui = FALSE,
  ...
)
```

## Arguments

MApopdat	List. Population data objects returned from modMApop().
MAMethod	String. mase (i.e., model-assisted) method to use ('greg', 'gregEN', 'ratio').
estvar	String. Name of the tree-level estimate variable (e.g., 'VOLCFNET').
estvar.filter	String. A tree-level filter for estvar. Must be R syntax (e.g., 'STATUSCD == 1').
estseed	String. Use seedling data only or add to tree data. Seedling estimates are only for counts (estvar='TPA_UNADJ')-( 'none', 'only', 'add').

landarea	String. The condition-level filter for defining land area ('ALL', 'FOREST', 'TIMBERLAND'). If landarea='FOREST', COND_STATUS_CD = 1; if landarea='TIMBERLAND', SITECLCD in(1:6) & RESERVCD = 0.
pcfilter	String. A filter for plot or cond attributes (including pltassgn). Must be R logical syntax.
rowvar	String. Optional. Name of domain variable to group estvar by for rows in table output. Rowvar must be included in an input data frame (i.e., plt, cond, tree). If no rowvar is included, an estimate is returned for the total estimation unit. Include colvar for grouping by 2 variables.
colvar	String. Optional. If rowvar != NULL, name of domain variable to group estvar by for columns in table output. Colvar must be included in an input data frame (i.e., plt, cond, tree).
prednames	String vector. Name(s) of predictor variables to include in model.
modelselect	Logical. If TRUE, variable selection occurs.
FIA	Logical. If TRUE, the finite population term is removed from estimator to match FIA estimates.
bootstrap	Logical. If TRUE, returns bootstrap variance estimates, otherwise uses Horvitz-Thompson estimator under simple random sampling without replacement.
returntitle	Logical. If TRUE, returns title(s) of the estimation table(s).
savadata	Logical. If TRUE, saves table(s) to outfolder.
table_opts	List. See help(table_options()) for a list of options.
title_opts	List. See help(title_options()) for a list of options.
savadata_opts	List. See help(savadata_options()) for a list of options. Only used when savadata = TRUE.
gui	Logical. If gui, user is prompted for parameters.
...	Parameters for modMApop() if MApopdat is NULL.

## Details

If variables are NULL, then it will prompt user to input variables.

Necessary variables:

Data	Variable	Description
tree	tuniqueid	Unique identifier for each plot, to link to pltassgn (e.g. PLT_CN).
	CONDID	Unique identifier of each condition on plot, to link to cond. Set CONDID=1, if only 1 condition per plot.
	TPA_UNADJ	Number of trees per acre each sample tree represents (e.g., DESIGNCD=1: TPA_UNADJ).
cond	cuniqueid	Unique identifier for each plot, to link to pltassgn (ex. PLT_CN).
	CONDID	Unique identifier of each condition on plot. Set CONDID=1, if only 1 condition per plot.
	CONDPROP_UNADJ	Unadjusted proportion of condition on each plot. Set CONDPROP_UNADJ=1, if only 1 condition per plot.
	COND_STATUS_CD	Status of each forested condition on plot (i.e. accessible forest, nonforest, water, etc).
	NF_COND_STATUS_CD	If ACI=TRUE. Status of each nonforest condition on plot (i.e. accessible nonforest, etc).
	SITECLCD	If landarea=TIMBERLAND. Measure of site productivity.
	RESERVCD	If landarea=TIMBERLAND. Reserved status.

	SUBPROP_UNADJ	Unadjusted proportion of subplot conditions on each plot. Set SUBPROP_UNADJ
	MICRPROP_UNADJ	If microplot tree attributes. Unadjusted proportion of microplot conditions on each
	MACRPROP_UNADJ	If macroplot tree attributes. Unadjusted proportion of macroplot conditions on each
pltassgn	puniqueid	Unique identifier for each plot, to link to cond (ex. CN).
	STATECD	Identifies state each plot is located in.
	INVYR	Identifies inventory year of each plot.
	PLOT_STATUS_CD	Status of each plot (i.e. sampled, nonsampled). If not included, all plots are assumed

Reference names are available for the following variables:

ADFORCD, AGENTCD, CCLCD, DECAYCD, DSTRBCD, KINDCD, OWNCD, OWNGRPCD, FORTYPCD, FLDTYPCD, FORTYPCDCALC, TYPGRPCD, FORINDCD, RESERVCD, LAND-CLCD, STDSZCD, FLDSZCD, PHYSCLCD, MIST\_CL\_CD, PLOT\_STATUS\_CD, STATECD, TREECLCD, TRTCD, SPCD, SPGRPCD

### Value

If FIA=TRUE or unitvar=NULL and colvar=NULL, one data frame is returned with tree estimates and percent sample errors. Otherwise, a list is returned with tree estimates in one data frame (est) and percent sample errors in another data frame (est.pse). If rawdata=TRUE, another list is returned including raw data used in the estimation process. If addtitle=TRUE and returtitle=TRUE, the title for est/pse is returned. If savedata=TRUE, all data frames are written to outfolder.

est	Data frame. Tree estimates by rowvar, colvar (and estimation unit). If FIA=TRUE or one estimation unit and colvar=NULL, estimates and percent sampling error are in one data frame.
pse	Data frame. Percent sampling errors for estimates by rowvar and colvar (and estimation unit).
titlelst	List with 1 or 2 string vectors. If returtitle=TRUE a list with table title(s). The list contains one title if est and pse are in the same table and two titles if est and pse are in separate tables.
raw	List of data frames. If rawdata=TRUE, a list including: number of plots by plot status, if in dataset (plotsampcnt); number of conditions by condition status (condsampcnt); data used for post-stratification (stratdat); and 1-8 tables with calculated variables used for processing estimates and percent sampling error for table cell values and totals (See processing data below).

### Raw data

plotsampcnt	Table. Number of plots by plot status (ex. sampled forest on plot, sampled nonforest, nonsampled).
condsampcnt	DF. Number of conditions by condition status (forest land, nonforest land, non-census water, census water, nonsampled).
stratdat	Data frame. Strata information by estimation unit.

Variable	Description
ESTUNIT	estimation unit

STRATA	strata
ACRES	area by strata for estimation unit
n.strata	number of plots in strata (and estimation unit)
n.total	number of plots for estimation unit
TOTACRES	total area for estimation unit
strwt	proportion of area (or number of plots) by strata (strata weight)
expfac.strata	expansion factor (in area unit (e.g., acres) by strata (areavar/n.strata)

#### processing data

Data frames. Separate data frames containing calculated variables used in estimation process. The number of processing tables depends on the input parameters. The tables include: total by estimation unit (unit.totest); rowvar totals (unit.rowest), and if colvar is not NULL, colvar totals, (unit.colvar); and a combination of rowvar and colvar (unit.grpvar). If FIA=TRUE, the raw data for the summed estimation units are also included (totest, rowest, colest, grpest, respectively). These tables do not included estimate proportions (nhat and nhat.var).

The data frames include the following information:

Variable	Description
nhat	estimated proportion of trees
nhat.var	estimated variance of estimated proportion of trees
ACRES	total area for estimation unit
est	estimated area of trees nhat*ACRES
est.var	estimated variance of estimated area of trees nhat.var*areavar^2
est.se	standard error of estimated area of trees sqrt(est.var)
est.cv	coefficient of variation of estimated area of trees est.se/est
pse	percent sampling error of estimate est.cv*100
CI99left	left tail of 99 percent confidence interval for estimated area
CI99right	right tail of 99 percent confidence interval for estimated area
CI95left	left tail of 95 percent confidence interval for estimated area
CI95right	right tail of 95 percent confidence interval for estimated area
CI67left	left tail of 67 percent confidence interval for estimated area
CI67right	right tail of 67 percent confidence interval for estimated area

Table(s) are also written to outfolder.

#### Note

##### ADJUSTMENT FACTOR:

The adjustment factor is necessary to account for nonsampled conditions. It is calculated for each estimation unit by strata. by summing the unadjusted proportions of the subplot, microplot, and macroplot (i.e. \*PROP\_UNADJ) and dividing by the number of plots in the strata/estimation unit).

An adjustment factor is determined for each tree based on the size of the plot it was measured on. This is identified using TPA\_UNADJ as follows:

**PLOT SIZE      TPA\_UNADJ**

SUBPLOT	6.018046
MICROPLOT	74.965282
MACROPLOT	0.999188

If ACI=FALSE, only nonsampled forest conditions are accounted for in the adjustment factor.

If ACI=TRUE, the nonsampled nonforest conditions are removed as well and accounted for in adjustment factor. This is if you are interested in estimates for all lands or nonforest lands in the All-Condition-Inventory.

sumunits:

An estimation unit is a population, or area of interest, with known area and number of plots. Individual counties or combined Super-counties are common estimation units for FIA. An estimation unit may also be a subpopulation of a larger population (e.g., Counties within a State). Subpopulations are mutually exclusive and independent within a population, therefore estimated totals and variances are additive. For example, State-level estimates are generated by summing estimates from all subpopulations within the State (Bechtold and Patterson. 2005. Chapter 2). Each plot must be assigned to only one estimation unit.

stratcombine:

If MAMethod='PS', and stratcombine=TRUE, and less than 2 plots in any one estimation unit, all estimation units with 10 or less plots are combined. The current method for combining is to group the estimation unit with less than 10 plots with the estimation unit following in consecutive order (numeric or alphabetical), restrained by survey unit (UNITCD) if included in dataset, and continuing until the number of plots equals 10. If there are no estimation units following in order, it is combined with the estimation unit previous in order.

autoxreduce:

If MAMethod='GREG', and autoxreduce=TRUE, and there is an error because of multicollinearity, a variable reduction method is applied to remove correlated variables. The method used is based on the variance-inflation factor (vif) from a linear model. The vif estimates how much the variance of each x variable is inflated due to multicollinearity in the model.

rowlut/collut:

There are several objectives for including rowlut/collut look-up tables: 1) to include descriptive names that match row/column codes in the input table; 2) to use number codes that match row/column names in the input table for ordering rows; 3) to add rows and/or columns with 0 values for consistency. No duplicate names are allowed.

Include 2 columns in the table:

1-the merging variable with same name as the variable in the input merge table;

2-the ordering or descriptive variable.

If the ordering variable is the rowvar/colvar in the input table and the descriptive variable is in rowlut/collut, set row.orderby/col.orderby equal to rowvar/colvar. If the descriptive variable is the rowvar/colvar in the input table, and the ordering code variable is in rowlut/collut, set row.orderby/col.orderby equal to the variable name of the code variable in rowlut/collut.

UNITS:

The following variables are converted from pounds (from FIA database) to short tons by multiplying the variable by 0.0005. DRYBIO\_AG, DRYBIO\_BG, DRYBIO\_WDLD\_SPP, DRYBIO\_SAPLING, DRYBIO\_STUMP, DRYBIO\_TOP, DRYBIO\_BOLE, DRYBIOT, DRYBIOM, DRYBIOTB, JBIOTOT, CARBON\_BG, CARBON\_AG

**MORTALITY:**

For Interior-West FIA, mortality estimates are mainly based on whether a tree has died within the last 5 years of when the plot was measured. If a plot was remeasured, mortality includes trees that were alive the previous visit but were dead in the next visit. If a tree was standing the previous visit, but was not standing in the next visit, no diameter was collected (DIA = NA) but the tree is defined as mortality.

Common tree filters:

<b>FILTER</b>	<b>DESCRIPTION</b>
"STATUSCD == 1"	Live trees
"STATUSCD == 2"	Dead trees
"TPAMORT_UNADJ > 0"	Mortality trees
"STATUSCD == 2 & DIA >= 5.0"	Dead trees >= 5.0 inches diameter
"STATUSCD == 2 & AGENTCD == 30"	Dead trees from fire

modPB

*Photo-Based module - Generate photo-based estimates.*

---

### Description

Generates percent, area or ratio-of-means estimates, with associated sampling error by domain (and estimation unit). Calculations are based on Patterson (2012) photo-based estimators for the Nevada photo-based inventory.

### Usage

```
modPB(
  PBpopdat = NULL,
  tabtype = "PCT",
  sumunits = FALSE,
  ratio = FALSE,
  landarea = "ALL",
  landarea.filter = NULL,
  nonsamp.pntfilter = NULL,
  pntfilter = NULL,
  pfilter = NULL,
  rowvar = NULL,
  colvar = NULL,
  domlut = NULL,
  domvarlst = NULL,
  ratioden = "ROWVAR",
  gainloss = FALSE,
  gainloss.vals = NULL,
  addtitle = FALSE,
  returntitle = FALSE,
  savedata = FALSE,
  table_opts = NULL,
  title_opts = NULL,
  savedata_opts = NULL,
  gui = FALSE,
  ...
)
```

### Arguments

PBpopdat	List. Population data objects returned from modPBpop().
tabtype	String. Type of units for the table ("PCT", "AREA").

sumunits	Logical. If TRUE, estimation units are combined to one table for output. Note: only available if tabtype="AREA". Acres
ratio	Logical. If TRUE, ratio estimates are generated.
landarea	String. Sample area for estimates ("ALL", "CHANGE"). Used to describe landarea.filter.
landarea.filter	String. filter for land area. Must be R syntax.
nonsamp.pntfilter	String. An expression for filtering nonsampled points (e.g., cloud coverage). Must be R syntax.
pntfilter	String. A global filter for the pnt file. Must be R syntax.
pfilter	String. A global filter for the plt file. Must be R syntax.
rowvar	String. Name of domain variable in pnt used for output estimation table rows. If only 1 domain, must be rowvar. If no domain, rowvar=NULL.
colvar	String. Name of domain variable in pnt used for output estimation table columns. If only 1 domain, colvar=NULL.
domlut	DF/DT or comma-delimited (*.csv). Look-up table to define the variables in the pnt table with category codes (DOMCODE) and code names (DOMNAME), and to set a pretty name for the variable to use in output table (DOMTITLE). This table is also used to populate rowvar/colvar, row.orderby/col.orderby, and title.rowvar/title.colvar parameters. Optional.
domvarlst	String vector. A vector of variable names that can be row or column domains (codes and names). Optional.
rationden	String. ("ROWVAR" or "COLVAR"). If ratio, defines whether the rowvar or colvar in estimation output table is the denominator.
gainloss	Logical. If TRUE, a table with the difference of gain and loss along with the variance and standard error, in percent, is generated.
gainloss.vals	String vector. A vector of names for values in gainloss table.
addtitle	Logical. If TRUE and savedata=TRUE, adds title to outfile.
returntitle	Logical. If TRUE, returns a character string of the title of the output data frame.
savedata	Logical. If TRUE, saves table(s) to outfolder.
table_opts	List. See help(table_options()) for a list of options.
title_opts	List. See help(title_options()) for a list of options.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE.
gui	Logical. If gui, user is prompted for parameters.
...	Parameters for modPBpop() if PBpopdat is NULL.

## Details

If variables are NULL, then it will prompt user to input variables.

**Value**

A list with estimates with percent sampling error for rowvar (and colvar). If sumunits=TRUE or unitvar=NULL and colvar=NULL, one data frame is returned. Otherwise, a list object is returned with the following information. If savedata=TRUE, all data frames are written to outfolder.

- est                    DF. Estimated percent cover or area by rowvar, colvar, (and estimation unit).
- pse                    DF. Percent sampling error of estimates by rowvar, colvar (and estimation unit).
- titlelst              List with 1 or 2 string vectors. If returntitle=TRUE a list with table title(s). The list contains one title if est and pse are in the same table and two titles if est and pse are in separate tables. Row and column tables are also included in list.
- raw                    List of data frames. If rawdata=TRUE, a list including the processing data used for estimation including: number of plots and conditions; stratification information; and 1 to 8 tables with calculated values for table cells and totals (See processing data below).

Raw data

- pntsampcnt            Table. Number of points by rowvar/colvar (sampled and nonsampled).
- stratdat              Data frame. Strata information by estimation unit.

Variable	Description
unitvar	estimation unit
strvar	strata
areavar	If tabtype='AREA', area by strata for estimation unit
n.strata	number of plots in strata (after totally nonsampled plots removed)
n.total	number of plots for estimation unit
TOTAREA	If tabtype='AREA', total area for estimation unit
strwt	proportion of area (or number of plots) by strata (strata weight)

processing data

Data frames. Separate data frames of variables used in estimation process for the rowvar, colvar and combination of rowvar and colvar (if colvar is not NULL), and grand total by estimation unit (unit.rowest, unit.colest, unit.grpest, respectively) and summed estimation units, if FIA=TRUE (rowest, colest, grpest, respectively).

The data frames include the following information:

	Variable	Description
	phat	estimated proportion of covered land
	phat.var	variance of estimated proportion of covered land
	areavar	If tabtype='AREA', total area for estimation unit
	est	If tabtype='AREA', estimated area of land phat
	est.var	variance of estimated area of land phat.var*area
If tabtype='PCT', estimated percent cover of land	phat.var*100	
	est.se	standard error of estimated area or percent cover
	est.cv	coefficient of variance of estimated area or percent cover

est.pse	percent sampling error of estimated area of percent cover
CI99left	left tail of 99 percent confidence interval for estimated area
CI99right	right tail of 99 percent confidence interval for estimated area
CI95left	left tail of 95 percent confidence interval for estimated area
CI95right	right tail of 95 percent confidence interval for estimated area
CI67left	left tail of 67 percent confidence interval for estimated area
CI67right	right tail of 67 percent confidence interval for estimated area

if ratio=TRUE:

Variable	Description
phat.n	estimated proportion of covered land, for denominator
phat.var.n	variance of estimated proportion of covered land, for denominator
phat.d	estimated proportion of covered land, for denominator
phat.var.d	variance of estimated proportion of covered land, for denominator
covar	covariance of estimated proportion of numerator and denominator
rhat	ratio of estimated proportions (numerator-denominator)
rhat.var	variance of ratio of estimated proportions
rhat.se	standard error of ratio of estimated proportions
rhat.cv	coefficient of variation of ratio of estimated proportions
areavar	If tabtype='AREA', total area for estimation unit
est	If tabtype='AREA', estimated area of land rhat*areavar
est.var	variance of estimated area of land rhat.var*areavar

If tabtype='PCT', estimated percent cover of land rhat.var\*100

est.se	standard error of estimated area or percent cover
est.cv	coefficient of variance of estimated area or percent cover
est.pse	percent sampling error of estimated area of percent cover
CI99left	left tail of 99 percent confidence interval for estimated area
CI99right	right tail of 99 percent confidence interval for estimated area
CI95left	left tail of 95 percent confidence interval for estimated area
CI95right	right tail of 95 percent confidence interval for estimated area
CI67left	left tail of 67 percent confidence interval for estimated area
CI67right	right tail of 67 percent confidence interval for estimated area

## Note

### STRATA:

Stratification is used to reduce variance in population estimates by partitioning the population into homogenous classes (strata), such as forest and nonforest. For stratified sampling methods, the strata sizes (weights) must be either known or estimated. Remotely-sensed data is often used to generate strata weights with proportion of pixels by strata. If stratification is desired (strata=TRUE), the required data include: stratum assignment for the center location of each plot, stored in either pltassgn or cond; and a look-up table with the area or proportion of the total area of each strata value by estimation unit, making sure the name of the strata (and estimation unit) variable and values match the plot assignment name(s) and value(s).

sumunits:

An estimation unit is a population, or area of interest, with known area and number of plots. Individual counties or combined Super-counties are common estimation units for FIA. An estimation unit may also be a subpopulation of a larger population (e.g., Counties within a State). Subpopulations are mutually exclusive and independent within a population, therefore estimated totals and variances are additive. For example, State-level estimates are generated by summing estimates from all subpopulations within the State (Bechtold and Patterson. 2005. Chapter 2). Each plot must be assigned to only one estimation unit.

If `sumunits=TRUE`, estimates are generated by estimation unit, summed together, and returned as one estimate. If `rawdata=TRUE`, estimates by individual estimation unit are also returned.

If `sumunits=FALSE`, estimates are generated and returned by estimation unit as one data frame. If `savedata=TRUE`, a separate file is written for each estimation unit.

`stratcombine`:

If `TRUE` and less than 2 plots in any one estimation unit, all estimation units with 10 or less plots are combined. The current method for combining is to group the estimation unit with less than 10 plots with the estimation unit following in consecutive order (numeric or alphabetical), restrained by survey unit (`UNITCD`) if included in dataset, and continuing until the number of plots equals 10. If there are no estimation units following in order, it is combined with the estimation unit previous in order.

`rowlut/collut`:

There are several objectives for including `rowlut/collut` look-up tables: 1) to include descriptive names that match row/column codes in the input table; 2) to use number codes that match row/column names in the input table for ordering rows; 3) to add rows and/or columns with 0 values for consistency. No duplicate names are allowed.

Include 2 columns in the table:

1-the merging variable with same name as the variable in the input merge table;

2-the ordering or descriptive variable.

If the ordering variable is the `rowvar/colvar` in the input table and the descriptive variable is in `rowlut/collut`, set `row.orderby/col.orderby` equal to `rowvar/colvar`. If the descriptive variable is the `rowvar/colvar` in the input table, and the ordering code variable is in `rowlut/collut`, set `row.orderby/col.orderby` equal to the variable name of the code variable in `rowlut/collut`.

)

cover1.unit.area.sum$est

```

---

modPBpop

*Photo-Based module - Generate population data for PB module.*

---

## Description

Generates population data for generating photo-based estimation. Plots that are totally nonsampled are excluded from estimation dataset. Next, an adjustment factor is calculated by strata to adjust for nonsampled (nonresponse) conditions that have proportion less than 1. Attributes adjusted to a per-acre value are summed by plot, divided by the adjustment factor, and averaged by stratum. Strata means are combined using the strata weights and then expanded to using the total land area in the population.

## Usage

```

modPBpop(

  strtype = "POST",
  stratalut = NULL,
  strvar = "STRATUMCD",
  pvars2keep = NULL,
  saveobj = FALSE,
  objnm = "PBpopdat",
  savedata = FALSE,
  unit_opts = NULL,
  strata_opts = NULL,

```

```

    savedata_opts = NULL,
    PBstratdat = NULL,
    gui = FALSE
  )

```

### Arguments

pntdat	DF/DT or comma-delimited file (*.csv). Point-level table with one record per point. If NULL, aggregated point counts must be in pntcnt.
pltpct	DF/DT or comma-delimited file (*.csv). Plot-domain-level table with percent observed by domain per plot.
plotid	String. Unique identifier of plot in pnt. All values must match puniqueid values, if pltassgn is not NULL.
pntid	String. Unique identifier of points in pnt.
pltpctvars	String vector. Variables in pltpct for estimation. If NULL, all variables are used except plotid in pltpct.
plt	DF/DT, comma-separated values (CSV) file (*.csv), or layer in dsn, Can also be a shapefile (*.shp) with one record per plot, a spatial layer in dsn, or a sf R object. Plot-level variables. If nonsampled plots are included, PLOT_STATUS_CD variable must be in table. Optional.
pltassgn	DF/DT, comma-delimited file (*.csv), SpatialDataFrame, or shapefile (*.shp). The plot-level data with one record per plot, including estimation unit and/or strata information. Optional.
puniqueid	String. Unique identifier of plot.
pltassgnid	String. Name of unique identifier of plot in pltassgn with All values must match plotid values if pnt is not NULL.
nonsamp.pfilter	String. An expression for filtering nonsampled plots. Must be R syntax.
sumunits	Logical. If TRUE, estimation units are combined to one table for output. Note: only available if tabtype="AREA". Acres
unitvar	String. Name of the estimation unit variable in cond or pltassgn with estimation unit assignment for each plot (e.g., 'ESTN_UNIT'). If one estimation unit, set unitvar=NULL.
unitarea	Numeric or DF. Total area by estimation unit. If only 1 estimation unit, include number of total acreage for the area of interest or a data frame with areavar. If more than one estimation unit, provide a data frame of total area by estimation unit, including unitvar and areavar.
areavar	String. Name of acre variable in unitarea. Default="ACRES".
strata	Logical. If TRUE, add data information for stratification.
strtype	String. If strata=TRUE, the type of strata ('POST', 'PRE'). Note: the variance equations are slightly different.
stratalut	DF/DT. If strata=TRUE, look-up table with strata proportions ('strwt') by strata (and estimation unit). To calculate 'strwt', set getwt=TRUE and getwtvar= name of variable with information to calculate weights from (e.g., pixel counts)

strvar	String. If strata=TRUE, name of the strata variable in stratalut and cond or pltassgn data frame with stratum assignment for each plot (Default = 'STRATUMCD').
pvars2keep	String vector. Additional plot variables to keep in dataset.
saveobj	Logical. If TRUE, saves SApopdat object to outfolder.
objnm	String. Name of *.rda object.
savedata	Logical. If TRUE, saves table(s) to outfolder.
unit_opts	List. See help(unit_options()) for a list of options.
strata_opts	List. See help(strata_options()) for a list of options. Only used when strata = TRUE.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE.
PBstratdat	R List object. Output data list components from FIESTA::DBgetStrata().
gui	Logical. If gui, user is prompted for parameters.

### Details

If variables are NULL, then it will prompt user to input variables.

Necessary variables:

Data	Variable	Description
tree	tuniqueid	Unique identifier for each plot, to link to pltassgn (ex. PLT_CN).
	CONDID	Unique identifier of each condition on plot, to link to cond. Set CONDID=1, if only 1 condition per plot.
	TPA_UNADJ	Number of trees per acre each sample tree represents (ex. DESIGNCD=1: TPA_UNADJ).
cond	cuniqueid	Unique identifier for each plot, to link to pltassgn (ex. PLT_CN).
	CONDID	Unique identifier of each condition on plot. Set CONDID=1, if only 1 condition per plot.
	CONDPROP_UNADJ	Unadjusted proportion of condition on each plot. Set CONDPROP_UNADJ=1, if only 1 condition per plot.
	COND_STATUS_CD	Status of each forested condition on plot (i.e. accessible forest, nonforest, water, etc).
	NF_COND_STATUS_CD	If ACI=TRUE. Status of each nonforest condition on plot (i.e. accessible nonforest, etc).
	SITECLCD	If landarea=TIMBERLAND. Measure of site productivity.
	RESERVCD	If landarea=TIMBERLAND. Reserved status.
	SUBPROP_UNADJ	Unadjusted proportion of subplot conditions on each plot. Set SUBPROP_UNADJ=1, if only 1 subplot condition per plot.
	MICRPROP_UNADJ	If microplot tree attributes. Unadjusted proportion of microplot conditions on each plot.
MACRPROP_UNADJ	If macroplot tree attributes. Unadjusted proportion of macroplot conditions on each plot.	
pltassgn	puniqueid	Unique identifier for each plot, to link to cond (ex. CN).
	STATECD	Identifies state each plot is located in.
	INVYR	Identifies inventory year of each plot.
	PLOT_STATUS_CD	Status of each plot (i.e. sampled, nonsampled). If not included, all plots are assumed sampled.

For available reference tables: sort(unique(FIESTAutils::ref\_codes\$VARIABLE))

**Value**

A list with population data for Green-Book estimates.

condx	Data frame. Condition-level data including plot-level assignment of estimation unit and stratum (if strata=TRUE) and adjusted condition proportion.
pltcondx	Data frame. Condition-level data, merged with plot data.
cuniqueid	String. Unique identifier of plot in condx and pltcondx.
condid	String. Unique identifier of condition in condx and pltcondx.
treex	Data frame. If esttype='TREE', tree-level data, including sample adjustment factor.
tuniqueid	String. If esttype='TREE', unique identifier of plot in treex.
ACI.filter	String. If ACI=FALSE, ACI.filter="COND_STATUS_CD == 1" .
unitarea	String. Returned table of area by estimation unit.
unitvar	String. Variable name for estimation unit.
strlut	String. Strata-level table with pixel counts by strata (P1POINTCNT), strata weights (strwt), number of plots by strata (n.strata), total number of plots in estimation unit (n.total), sum of condition proportions (*_UNADJ_SUM), area adjustments (*_ADJFAC), total area, and area expansion by strata (EXPNS).
strvar	String. Variable name for strata. If strata=FALSE, strvar="ONESTRAT".
expcondtab	String. If ACI=FALSE, ACI.filter="COND_STATUS_CD == 1" .
plotsampcnt	Data frame. Number of plots by PLOT_STATUS_CD.
condsampcnt	Data frame. Number of conditions by COND_STATUS_CD.
states	String. State names in dataset.
invyrs	String. Range of inventory years in dataset.
stratdat	Data frame. Strata information by estimation unit.

**Variable**

Variable	Description
unitvar	estimation unit
strvar	stratum value
strwtvar	number of pixels by strata and estimation unit
n.strata	number of plots in strata (after totally nonsampled plots removed)
n.total	number of plots for estimation unit
strwt	proportion of area (or plots) by strata and estimation unit (i.e., strata weight)
CONDPROP_UNADJ_SUM	summed condition proportion by strata and estimation unit
CONDPROP_ADJFAC	adjusted condition proportion by strata after nonsampled plots removed
AREA_USED	total area of estimation unit
expfac	strata-level expansion factor after nonsampled plots and conditions removed (AREA_USED/AREA_USED)
EXPNS	strata-level area expansions (expfac * strwt)

Table(s) are also written to outfolder.

**Note****ADJUSTMENT FACTOR:**

The adjustment factor is necessary to account for nonsampled conditions. It is calculated for each estimation unit by strata. by summing the unadjusted proportions of the subplot, microplot, and macroplot (i.e. \*PROP\_UNADJ) and dividing by the number of plots in the strata/estimation unit).

An adjustment factor is determined for each tree based on the size of the plot it was measured on. This is identified using TPA\_UNADJ as follows:

<b>PLOT SIZE</b>	<b>TPA_UNADJ</b>
SUBPLOT	6.018046
MICROPLOT	74.965282
MACROPLOT	0.999188

If ACI=FALSE, only nonsampled forest conditions are accounted for in the adjustment factor.

If ACI=TRUE, the nonsampled nonforest conditions are removed as well and accounted for in adjustment factor. This is if you are interested in estimates for all lands or nonforest lands in the All-Condition-Inventory.

unitcombine:

If TRUE and less than 2 plots in any one estimation unit, all estimation units with 10 or less plots are combined. The current method for combining is to group the estimation unit with less than 10 plots with the estimation unit following in consecutive order (numeric or alphabetical), restrained by survey unit (UNITCD) if included in dataset, and continuing until the number of plots equals 10. If there are no estimation units following in order, it is combined with the estimation unit previous in order.

stratcombine:

If TRUE and less than 2 plots in any one strata class within an estimation unit, all strata classes with 2 or less plots are combined. The current method for combining is to group the strata with less than 2 plots with the strata class following in consecutive order (numeric or alphabetical), restrained by estimation unit (if unitcombine=FALSE), and continuing until the number of plots equals 10. If there are no strata classes following in order, it is combined with the estimation unit previous in order.

                     pntid = "dot_cnt",
                     unitarea = unitarea,
                     unitvar = "ESTN_UNIT")

```

---

modSAarea

*Small area module - Generate small area tree estimates.*

---

## Description

Generates small area estimates by domain and/or tree domain (and estimation unit).

## Usage

```

modSAarea(
  SApopdatlst = NULL,
  prednames = NULL,
  SApkg = "JoSAE",
  SAmethod = "area",
  estseed = "none",

```

```

largebnd.unique = NULL,
landarea = "FOREST",
pcfilter = NULL,
rowvar = NULL,
modelselect = FALSE,
prior = function(x) 1/(sqrt(x) * (1 + x)),
na.fill = "NONE",
savedata = FALSE,
savesteps = FALSE,
multest = FALSE,
addSAdomsdf = TRUE,
SAdomvars = NULL,
savemultest = FALSE,
returntitle = FALSE,
table_opts = NULL,
title_opts = NULL,
savedata_opts = NULL,
multest_opts = NULL,
save4testing = FALSE,
gui = FALSE,
...
)

```

### Arguments

<code>SApopdatlst</code>	List. List of population data objects returned from <code>modSApop()</code> .
<code>prednames</code>	String vector. Name(s) of predictor variables to use in model.
<code>SAPackage</code>	String. Small area package to use ('JoSAE', 'sae', 'hbsae')
<code>SAMethod</code>	String. Small area method to use ('unit', 'area')
<code>estseed</code>	String. Use seedling data only or add to tree data. Seedling estimates are only for counts ( <code>estvar='TPA_UNADJ'</code> )-('none', 'only', 'add').
<code>largebnd.unique</code>	String. Name of the large boundary unique identifier to define plots within a model extent. If NULL, all plots are used for model extent.
<code>landarea</code>	String. The sample area filter for estimates ('ALL', 'FOREST', 'TIMBERLAND'). If <code>landarea=FOREST</code> , filtered to <code>COND_STATUS_CD = 1</code> ; If <code>landarea=TIMBERLAND</code> , filtered to <code>SITECLCD</code> in(1:6) and <code>RESERVCD = 0</code> .
<code>pcfilter</code>	String. A filter for plot or cond attributes (including <code>pltassgn</code> ). Must be R logical syntax.
<code>rowvar</code>	String. Name of the row domain variable in cond or tree. If only one domain, <code>rowvar = domain variable</code> . If more than one domain, include <code>colvar</code> . If no domain, <code>rowvar = NULL</code> .
<code>modelselect</code>	Logical. If TRUE, selects useful predictors using <code>mase:ElasticNet</code> .
<code>prior</code>	Function. A prior function to use for <code>hbsae</code> models.

na.fill	String. An estimate to fill in for NA values (i.e., when model is unstable or no predictors are selected). Choose from the following list that does not include SApackage used ('NONE', 'DIR', 'JoSAE', 'sae', 'hbsae'). DIR is suggested value for no NA values.
savedata	Logical. If TRUE, saves table(s) to outfolder.
savesteps	Logical. Saves graphs of predictors and response with labels whether selected or not for both area- and unit-level models.
multest	Logical. If TRUE, returns a data frame of SA estimates using both unit-level and area-level estimates.
addSAdom sdf	Logical. If TRUE, appends SAdom sdf to unit.multest table for output.
SAdomvars	String vector. List of attributes from SAdoms to include in multest output.
savemultest	Logical. If TRUE, save table with area- and unit-level estimates.
returntitle	Logical. If TRUE, returns title(s) of the estimation table(s).
table_opts	List. See help(table_options()) for a list of options.
title_opts	List. See help(title_options()) for a list of options.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE.
multest_opts	List. See help(multest_options()) for a list of options. Only used when multest = TRUE.
save4testing	Logical. If TRUE, saves intermediate steps as R objects to outfolder for testing (pdomdat, dunitlut).
gui	Logical. If gui, user is prompted for parameters.
...	Parameters for modSApop if SApopdat is NULL.

## Details

If variables are NULL, then it will prompt user to input variables.

Necessary variables:

Data	Variable	Description
tree	tuniqueid	Unique identifier for each plot, to link to pltstrat (e.g., PLT_CN).
	CONDID	Unique identifier of each condition on plot, to link to cond. Set CONDID=1, if on
	TPA_UNADJ	Number of trees per acre each sample tree represents (ex. DESIGNCD=1: TPA_U
cond	cuniqueid	Unique identifier for each plot, to link to pltstrat (ex. PLT_CN).
	CONDID	Unique identifier of each condition on plot. Set CONDID=1, if only 1 condition pe
	CONDPROP_UNADJ	Unadjusted proportion of condition on each plot. Set CONDPROP_UNADJ=1, if
	COND_STATUS_CD	Status of each forested condition on plot (i.e. accessible forest, nonforest, water, e
	NF_COND_STATUS_CD	If ACI=TRUE. Status of each nonforest condition on plot (i.e. accessible nonfores
	SITECLCD	If landarea=TIMBERLAND. Measure of site productivity.
	RESERVCD	If landarea=TIMBERLAND. Reserved status.
	SUBPROP_UNADJ	Unadjusted proportion of subplot conditions on each plot. Set SUBPROP_UNADJ
	MICRPROP_UNADJ	If microplot tree attributes. Unadjusted proportion of microplot conditions on each
	MACRPROP_UNADJ	If macroplot tree attributes. Unadjusted proportion of macroplot conditions on each

pltassign	puniqueid STATECD INVYR PLOT_STATUS_CD	Unique identifier for each plot, to link to cond (ex. CN). Identifies state each plot is located in. Identifies inventory year of each plot. Status of each plot (i.e. sampled, nonsampled). If not included, all plots are assumed
-----------	---	--

Reference names are available for the following variables:

ADFORCD, AGENTCD, CCLCD, DECAYCD, DSTRBCD, KINDCD, OWNCD, OWNGRPCD, FORTYPCD, FLDTYPCD, FORTYPCDCALC, TYPGRPCD, FORINDCD, RESERVCD, LANDCLCD, STDSZCD, FLDSZCD, PHYSCLCD, MIST\_CL\_CD, PLOT\_STATUS\_CD, STATECD, TREECLCD, TRTCD, SPCD, SPGRPCD

**Value**

est	Data frame. Tree estimates and percent sampling error by domain. Estimates are based on the SApkage and SAMethod parameters defined.
titlelst	List. List of titles used for table output.
raw	List of raw data. If rawdata=TRUE, a list including raw data components used for calculating estimate.
dunit.multest	Data frame. Table comparing different estimation strategies for SAE.
Raw data	
domdat	Data frame. Domain-level data used for estimation.
dunit.totest	String. Table of estimates, including more details.

**Note**

**ADJUSTMENT FACTOR:**

The adjustment factor is necessary to account for nonsampled conditions. For model-based estimation, we calculate adjustment factors by plot.

It is calculated by dividing 1 / summed condition proportions by plot. An adjustment factor is determined for each tree based on the size of the plot it was measured on. This is identified using TPA\_UNADJ as follows:

PLOT SIZE	TPA_UNADJ
SUBPLOT	6.018046
MICROPLOT	74.965282
MACROPLOT	0.999188

If ACI=FALSE, only nonsampled forest conditions are accounted for in the adjustment factor.

If ACI=TRUE, the nonsampled nonforest conditions are removed as well and accounted for in adjustment factor. This is if you are interested in estimates for all lands or nonforest lands in the All-Condition-Inventory.

```

---

 modSApop

---

*Small area module - Compile population data for SA module.*

---

**Description**

Compile population data for input to the modSA\* modules.

**Usage**

```

modSApop(
  popType = "VOL",
  popTabs = popTables(),
  popTabIDs = popTableIDs(),
  popFilter = popFilters(),
  pltassgn = NULL,
  pltassgnid = "PLT_CN",
  dsn = NULL,
  pjoinid = "CN",
  areawt = "CONDPROP_UNADJ",
  adjplot = TRUE,
  dunitvar = NULL,
  dunitarea = NULL,
  areavar = "ACRES",
  dunitzonal = NULL,
  prednames = NULL,
  predfac = NULL,
  savedata = FALSE,
  saveobj = FALSE,
  objnm = "SApopdat",
  unit_opts = NULL,
  savedata_opts = NULL,
  SAdoms = NULL,
  smallbnd = NULL,
  smallbnd.domain = NULL,
  SAdata = NULL,
  pltat = NULL,
  auxdat = NULL,
  gui = FALSE,
  ...
)

```

**Arguments**

popType	String. Type of evaluation(s) to include in population data. Note: currently only c('CURR', 'VOL', 'LULC') are available. See details below for descriptions of each.
popTabs	List of population tables the user would like returned. See help(popTables) for a list of options.
popTabIDs	List of unique IDs corresponding to the population tables that the user has requested. See help(popTableIDs) for a list of options.
popFilter	List of population filters. See help(popFilters) for a list of options.
pltassgn	DF/DT, comma-separated values (CSV) file(*.csv), or layer in dsn, Can also be a shapefile(*.shp) with one record per plot, a spatial layer in dsn, or a sf R object. Plot-level assignment of estimation unit and/or strata. Optional.
pltassgnid	String. Unique identifier of plot in pltassgn.

dsn	String. Name of database where tree, cond, and pltassgn tables reside. The dsn varies by driver. See gdal OGR vector formats ( <a href="https://www.gdal.org/ogr_formats.html">https://www.gdal.org/ogr_formats.html</a> ).
pjoinid	String. Join variable in plot to match pltassgnid. Does not need to be uniqueid. If using most current XY coordinates for plot assignments, use identifier for plot (e.g., PLOT_ID).
areawt	String. Name of variable for summarizing area weights (e.g., CONDPROP_UNADJ).
adjplot	Logical. If TRUE, adjusts for nonresponse at plot-level.
dunitvar	String. Name of the domain unit variable in cond, plt, or pltassgn with domain unit assignment for each plot.
dunitarea	Numeric or DF. Total area by domain unit.
areavar	String. Name of area variable in unitarea. Default="ACRES".
dunitzonal	DF/DT. Data frame with zonal auxiliary information by domain unit. For continuous data, means by domain unit; for categorical data, proportion of class by domain unit.
prednames	String vector. Name(s) of predictor variables to use in model.
predfac	String vector. Name(s) of factor predictor variables to use in model. Names will change in output depending on number of categories.
savedata	Logical. If TRUE, saves table(s) to outfolder.
saveobj	Logical. If TRUE, saves returned list object to outfolder.
objnm	String. Name of *.rds object.
unit_opts	List. See <code>help(unit_options())</code> for a list of options.
savedata_opts	List. See <code>help(savedata_options())</code> for a list of options.
SAdoms	sf object. SA domains with attributes for joining.
smallbnd	sf object. small bound.
smallbnd.domain	String. Name of attribute defining domain attribute.
SAdata	R List object. Output data list components from <code>FIESTA::SAdata()</code> .
pltdat	R List object. Output data list components from <code>FIESTA::spGetPlots()</code> .
auxdat	R List object. Output data list components from <code>FIESTA::spGetAuxiliary()</code> .
gui	Logical. If gui, user is prompted for parameters.
...	For extensibility.

## Details

If variables are NULL, then it will prompt user to input variables.

Necessary variables:

Data	Variable	Description
tree	tuniqueid	Unique identifier for each plot, to link to pltassgn (e.g. PLT_CN).
	CONDID	Unique identifier of each condition on plot, to link to cond. Set CONDID=1, if only one condition.
	TPA_UNADJ	Number of trees per acre each sample tree represents (e.g. DESIGNCD=1: TPA_UNADJ).

cond	cuniqueid	Unique identifier for each plot, to link to pltassgn (e.g. PLT_CN).
	CONDID	Unique identifier of each condition on plot. Set CONDID=1, if only 1 condition per plot.
	CONDPROP_UNADJ	Unadjusted proportion of condition on each plot. Set CONDPROP_UNADJ=1, if only 1 condition per plot.
	COND_STATUS_CD	Status of each forested condition on plot (i.e. accessible forest, nonforest, water, etc.).
	NF_COND_STATUS_CD	If ACI=TRUE. Status of each nonforest condition on plot (i.e. accessible nonforest, etc.).
	SITECLCD	If landarea=TIMBERLAND. Measure of site productivity.
	RESERVCD	If landarea=TIMBERLAND. Reserved status.
	SUBPROP_UNADJ	Unadjusted proportion of subplot conditions on each plot. Set SUBPROP_UNADJ=1, if only 1 subplot per plot.
	MICRPROP_UNADJ	If microplot tree attributes. Unadjusted proportion of microplot conditions on each plot.
pltassgn	MACRPROP_UNADJ	If macroplot tree attributes. Unadjusted proportion of macroplot conditions on each plot.
	puniqueid	Unique identifier for each plot, to link to cond (e.g. CN).
	STATECD	Identifies state each plot is located in.
	INVYR	Identifies inventory year of each plot.
	PLOT_STATUS_CD	Status of each plot (i.e. sampled, nonsampled). If not included, all plots are assumed sampled.

For available reference tables: `sort(unique(FIESTAutils::ref_codes$VARIABLE))`

## Value

A list with population data for Small-Area estimates.

SAdomsdf	Data frame. Attribute table from SAdoms spatial layer. Includes DOMAIN and AOI attributes. DOMAIN represents modeling domains. AOI identifies the small area of interest.
condx	Data frame. Condition-level data with condition proportions, domain and predictor assignments, and adjusted condition proportions, if <code>adjplot = TRUE</code> .
pltcondx	Data frame. Plot/Condition data used for estimation.
cuniqueid	String. Unique identifier of plot in <code>condx</code> and <code>pltcondx</code> .
condid	String. Unique identifier of condition in <code>condx</code> and <code>pltcondx</code> .
treex	Data frame. If <code>esttype='TREE'</code> , tree-level data, including adjustment factors, if <code>adjplot = TRUE</code> .
tuniqueid	String. If <code>esttype='TREE'</code> , unique identifier of plot in <code>treex</code> .
ACI.filter	String. If <code>ACI=FALSE</code> , <code>ACI.filter="COND_STATUS_CD == 1"</code> .
dunitarea	Data frame. Area by model domain unit.
areavar	String. Name of area variable in <code>dunitarea</code> .
dunitvar	String. Name of variable defining model domain units in <code>dunitarea</code> .
dunitlut	Data frame. Table of model domain units with zonal statistics of predictor values, number of plots by domain unit.
prednames	String vector. Name of variables in <code>dunitlut</code> and <code>condx</code> defining potential predictors for small area estimation.
plotsampcnt	Data frame. Number of plots by <code>PLOT_STATUS_CD</code> .
condsampcnt	Data frame. Number of conditions by <code>COND_STATUS_CD</code> .

states	String. State names in dataset.
invyrs	String. Range of inventory years in dataset.
adjtree	Logical. If TRUE, treex includes adjustment factors.

**Note****ADJUSTMENT FACTOR:**

The adjustment factor is necessary to account for nonsampled conditions. For model-based estimation, we calculate adjustment factors by plot.

It is calculated by dividing 1 / summed condition proportions by plot. An adjustment factor is determined for each tree based on the size of the plot it was measured on. This is identified using TPA\_UNADJ as follows:

PLOT SIZE	TPA_UNADJ
SUBPLOT	6.018046
MICROPLOT	74.965282
MACROPLOT	0.999188

If ACI=FALSE, only nonsampled forest conditions are accounted for in the adjustment factor.

If ACI=TRUE, the nonsampled nonforest conditions are removed as well and accounted for in adjustment factor. This is if you are interested in estimates for all lands or nonforest lands in the All-Condition-Inventory.

  multest_opts = NULL,
  save4testing = FALSE,
  gui = FALSE,
  ...
)

```

**Arguments**

SApopdatlst	List. List of population data objects returned from modSApop().
prednames	String vector. Name(s) of predictor variables to use in model.
SAPackage	String. Small area package to use ('JoSAE', 'sae', 'hbsae')
SAMethod	String. Small area method to use ('unit', 'area')
estseed	String. Use seedling data only or add to tree data. Seedling estimates are only for counts (estvar='TPA_UNADJ')-( 'none', 'only', 'add').
largebnd.unique	String. Name of the large boundary unique identifier to define plots within a model extent. If NULL, all plots are used for model extent.
landarea	String. The sample area filter for estimates ('ALL', 'FOREST', 'TIMBERLAND'). If landarea=FOREST, filtered to COND_STATUS_CD = 1; If landarea=TIMBERLAND, filtered to SITECLCD in(1:6) and RESERVCD = 0.
pcfilter	String. A filter for plot or cond attributes (including pltassgn). Must be R logical syntax.
estvar	String. Name of the tree estimate variable.
estvar.filter	String. A tree filter for estimate variable. Must be R syntax (e.g., "STATUSCD == 1").
rowvar	String. Name of the row domain variable in cond or tree. If only one domain, rowvar = domain variable. If more than one domain, include colvar. If no domain, rowvar = NULL.
modelselect	Logical. If TRUE, selects useful predictors using mase:ElasticNet.
prior	Function. A prior function to use for hbsae models.
na.fill	String. An estimate to fill in for NA values (i.e., when model is unstable or no predictors are selected). Choose from the following list that does not include SAPackage used ('NONE', 'DIR', 'JoSAE', 'sae', 'hbsae'). DIR is suggested value for no NA values.
savedata	Logical. If TRUE, saves table(s) to outfolder.
savesteps	Logical. Saves graphs of predictors and response with labels whether selected or not for both area- and unit-level models.
multest	Logical. If TRUE, returns a data frame of SA estimates using both unit-level and area-level estimates.
addSAdomdf	Logical. If TRUE, appends SAdomdf to unit.multest table for output.
SAdomvars	String vector. List of attributes from SAdoms to include in multest output.
savemultest	Logical. If TRUE, save table with area- and unit-level estimates.
returntitle	Logical. If TRUE, returns title(s) of the estimation table(s).
table_opts	List. See help(table_options()) for a list of options.
title_opts	List. See help(title_options()) for a list of options.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE.

multest_opts	List. See help(multest_options()) for a list of options. Only used when multest = TRUE.
save4testing	Logical. If TRUE, saves intermediate steps as R objects to outfolder for testing (pdomdat, dunitlut).
gui	Logical. If gui, user is prompted for parameters.
...	Parameters for modSApop() if SApopdat is NULL.

## Details

If variables are NULL, then it will prompt user to input variables.

Necessary variables:

Data	Variable	Description
tree	tuniqueid	Unique identifier for each plot, to link to pltstrat (e.g., PLT_CN).
	CONDID	Unique identifier of each condition on plot, to link to cond. Set CONDID=1, if on
	TPA_UNADJ	Number of trees per acre each sample tree represents (e.g. DESIGNCD=1: TPA_U
cond	cuniqueid	Unique identifier for each plot, to link to pltstrat (ex. PLT_CN).
	CONDID	Unique identifier of each condition on plot. Set CONDID=1, if only 1 condition pe
	CONDPROP_UNADJ	Unadjusted proportion of condition on each plot. Set CONDPROP_UNADJ=1, if
	COND_STATUS_CD	Status of each forested condition on plot (i.e. accessible forest, nonforest, water, e
	NF_COND_STATUS_CD	If ACI=TRUE. Status of each nonforest condition on plot (i.e. accessible nonfores
	SITECLCD	If landarea=TIMBERLAND. Measure of site productivity.
	RESERVCD	If landarea=TIMBERLAND. Reserved status.
	SUBPROP_UNADJ	Unadjusted proportion of subplot conditions on each plot. Set SUBPROP_UNAD
pltassign	MICRPROP_UNADJ	If microplot tree attributes. Unadjusted proportion of microplot conditions on each
	MACRPROP_UNADJ	If macroplot tree attributes. Unadjusted proportion of macroplot conditions on each
	puniqueid	Unique identifier for each plot, to link to cond (ex. CN).
	STATECD	Identifies state each plot is located in.
	INVYR	Identifies inventory year of each plot.
	PLOT_STATUS_CD	Status of each plot (i.e. sampled, nonsampled). If not included, all plots are assum

Reference names are available for the following variables:

ADFORCD, AGENTCD, CCLCD, DECAYCD, DSTRBCD, KINDCD, OWNCD, OWNGRPCD, FORTYPCD, FLDTYPCD, FORTYPCDCALC, TYPGRPCD, FORINDCD, RESERVCD, LANDCLCD, STDSZCD, FLDSZCD, PHYSCLCD, MIST\_CL\_CD, PLOT\_STATUS\_CD, STATECD, TREECLCD, TRTCD, SPCD, SPGRPCD

## Value

est	Data frame. Tree estimates and percent sampling error by domain. Estimates are based on the SApackage and SAMethod parameters defined.
titlelst	List. List of titles used for table output.
raw	List of raw data. If rawdata=TRUE, a list including raw data components used for calculating estimate.

dunit.multest	Data frame. Table comparing different estimation strategies for SAE.
Raw data	
domdat	Data frame. Domain-level data used for estimation.
estvar	String. Name of estimation variable.
estvar.filter	String. Logical filter specified for tree data.
dunit.totest	String. Table of estimates, including more details.

### Note

#### ADJUSTMENT FACTOR:

The adjustment factor is necessary to account for nonsampled conditions. For model-based estimation, we calculate adjustment factors by plot.

It is calculated by dividing 1 / summed condition proportions by plot. An adjustment factor is determined for each tree based on the size of the plot it was measured on. This is identified using TPA\_UNADJ as follows:

PLOT SIZE	TPA_UNADJ
SUBPLOT	6.018046
MICROPLOT	74.965282
MACROPLOT	0.999188

If ACI=FALSE, only nonsampled forest conditions are accounted for in the adjustment factor.

If ACI=TRUE, the nonsampled nonforest conditions are removed as well and accounted for in adjustment factor. This is if you are interested in estimates for all lands or nonforest lands in the All-Condition-Inventory.

Common tree filters for estvar.filter:

FILTER	DESCRIPTION
"STATUSCD == 1"	Live trees
"STATUSCD == 2"	Dead trees
"TPAMORT_UNADJ > 0"	Mortality trees
"STATUSCD == 2 & DIA >= 5.0"	Dead trees >= 5.0 inches diameter
"STATUSCD == 2 & AGENTCD == 30"	Dead trees from fire

          estvar.filter = "STATUSCD == 1")
```

---

popFilters

*Population data filters.*

---

## Description

Returns a list of user-supplied parameters and parameter values for population data filters.

## Usage

```
popFilters(
  evalid = NULL,
  invyrs = NULL,
  intensity = NULL,
  measCur = FALSE,
```

```

    measEndyr = NULL,
    measEndyr.filter = NULL,
    ACI = FALSE,
    ...
)

```

### Arguments

evalid	Numeric. FIA Evaluation identifier for subsetting plots for population.
invyrs	Integer vector. Inventory year(s) (e.g., c(2000, 2001, 2002)).
intensity	Integer code. Code(s) indicating intensity to use for population.
measCur	Logical. Inventory span defining variable. If TRUE, extract plots with most current measurement for state(s).
measEndyr	Logical. Inventory span defining variable. If TRUE, extract plots with most current measurement for state(s) for years measured in or before measEndyr.
measEndyr.filter	Filter for extracting plots using measEndyr. Must be in R syntax (e.g., 'AOI == 1').
ACI	Logical. If TRUE, including All Condition Inventory (ACI) plots.
...	For extensibility.

### Details

If no parameters, an empty list is returned.

### Value

A list of user-supplied parameters and parameter values for population data filters.

### Author(s)

Grayson W. White

### Examples

```
popFilters(ACI = TRUE)
```

---

popTableIDs

*List of population table unique IDs.*

---

### Description

Returns a list of user-supplied parameters and parameter values for data table unique IDs to be supplied to \*pop functions.

**Usage**

```

popTableIDs(
  cond = "PLT_CN",
  plt = "CN",
  tree = "PLT_CN",
  seed = "PLT_CN",
  vsubsp spp = "PLT_CN",
  vsubpstr = "PLT_CN",
  invsubp = "PLT_CN",
  subplot = "PLT_CN",
  subp_cond = "PLT_CN",
  cond_dwm_calc = "PLT_CN",
  sccm = "PLT_CN",
  grm = "PLT_CN",
  plot_pplot = "PLT_CN",
  cond_pcond = "PLT_CN",
  ...
)

```

**Arguments**

cond	String. Unique identifier of plot in cond.
plt	String. Unique identifier of plot in plt.
tree	String. Unique identifier of plot in tree and seed.
seed	String.
vsubsp spp	String.
vsubpstr	String.
invsubp	String.
subplot	String.
subp_cond	String.
cond_dwm_calc	String.
sccm	String.
grm	String.
plot_pplot	String.
cond_pcond	String.
...	For extendibility.

**Details**

If no parameters, an empty list is returned.

**Value**

A list of user-supplied parameters and parameter values for strata.

**Author(s)**

Grayson W. White

**Examples**

```
popTableIDs(cond = "my_unique_id", tree = "my_tree_id")
```

---

 popTables

*List of population tables.*

---

**Description**

Returns a list of user-supplied parameters and parameter values for data tables to be supplied to \*pop functions.

**Usage**

```
popTables(
  cond = NULL,
  plt = NULL,
  tree = NULL,
  seed = NULL,
  vsubpspp = NULL,
  vsubpstr = NULL,
  invsubp = NULL,
  subplot = NULL,
  subp_cond = NULL,
  cond_dwm_calc = NULL,
  sccm = NULL,
  grm = NULL,
  plot_pplot = NULL,
  cond_pcond = NULL,
  ...
)
```

**Arguments**

cond	DF/DT, R object, comma-delimited file(*.csv), or layer in dsn. Condition-level data with one record for each condition, including or excluding nonsampled conditions. Plot variables and strata/estimation unit variable(s) may be included if plt and pltassgn=NULL. See details for necessary variables to include.
plt	DF/DT, Optional. R object, sf R object, comma-delimited file(*.csv), layer or spatial layer in dsn, or shapefile(*.shp). Plot-level data with one record for each plot, including or excluding nonsampled conditions. If nonsampled plots are included, PLOT_STATUS_CD variable must be in table or a filter defined in plt.nonsamp.filter.

tree	DF/DT, R object, comma-delimited file(*.csv), or layer in dsn. Tree-level data with one record for each tree. Tree data are aggregated to condition-level. See details for necessary variables to include.
seed	DF/DT, R object, comma-delimited file(*.csv), or layer in dsn. Seedling data with one record for each seedling count.
vsubpspp	DF/DT, R object, comma-delimited file(*.csv), or layer in dsn. Vegetation species-level data with one record for each species (P2VEG_SUBPLOT_SPP).
vsubpstr	DF/DT, R object, comma-delimited file(*.csv), or layer in dsn. Vegetation species-structure data with one record for each species (P2VEG_SUBP_STRUCTURE).
invsubp	DF/DT, R object, comma-delimited file(*.csv), or layer in dsn. Invasive species data with one record for each species (INVASIVE_SUBPLOT_SPP).
subplot	DF/DT, R object, comma-delimited file(*.csv), or layer in dsn. Subplot-level data with one record for each species (SUBPLOT).
subp_cond	DF/DT, R object, comma-delimited file(*.csv), or layer in dsn. Subplot condition-level data with one record for each species (SUBP_COND).
cond_dwm_calc	DF/DT, R object, comma-delimited file(*.csv), or layer in dsn. Calculated down woody material.
sccm	DF/DT, R object, comma-delimited file(*.csv), or layer in dsn. Subplot-level data (SUBP_COND_CHNG_MTRX).
grm	DF/DT, R object, comma-delimited file(*.csv), or layer in dsn. Tree-level growth, removal, and mortality data (TREE_GRM_COMPONENT).
plot_pplot	DF/DT, R object, comma-delimited file(*.csv), or layer in dsn. Plot-level data with previous and current plots.
cond_pcond	DF/DT, R object, comma-delimited file(*.csv), or layer in dsn. Condition-level data with previous and current plots.
...	For extensibility.

**Details**

If no parameters, an empty list is returned.

**Value**

A list of user-supplied parameters and parameter values for strata.

**Author(s)**

Grayson W. White

**Examples**

```
popTables(cond = FIESTA::WYcond, seed = FIESTA::WYseed)
```

---

 ref\_ALP

*Reference table - for Automated Land Program National Forests.*

---

**Description**

National Forest region and names from the USDA S\_USA.BasicOwnershipFS (Surface Ownership Parcels) attribute table. An area depicted as surface ownership parcels dissolved on the same ownership classification

**Format**

A dataframe with 2 columns, R1 and FORESTNAME.

**Note**

```
## ALP National Forest boundary alp_dsn <- "S_USA.BasicOwnershipFS.gdb" alp_layer <- "BasicOwnershipFS" alp_att <- "FORESTNAME" alp_bnd <- spImportSpatial(dsn=alp_dsn, layer=alp_layer)
alp_names <- unique(sf::st_drop_geometry(alp_bnd[, c("REGION", "FORESTNAME")])) alp_names
<- alp_names[order(alp_names$REGION, alp_names$FORESTNAME),] alp_names <- alp_names[grepl("National
Forest", alp_names$FORESTNAME)==TRUE,] alp_names$FORESTNAME <- sub(" National For-
est", "", alp_names$FORESTNAME)
```

Ownership classes that are not USDA Forest Service were removed from the layer.

```
OWNERCLASSIFICATION = "USDA FOREST SERVICE" subset with following query alpfs <-
alpfs[!is.na(alpfs$OWNERCLASSIFICATION) & alpfs$OWNERCLASSIFICATION != 'NON-
FS',]
```

---

spClipPoint	<i>Spatial - Clip (intersect) point vector layer with polygon vector layer.</i>
-------------	---

---

## Description

Wrapper for sf::st\_intersection, to clip (intersect) point vector layer with a polygon vector layer.

## Usage

```
spClipPoint(
  xyplt,
  xyplt_dsn = NULL,
  uniqueid = "PLT_CN",
  clippolyv,
  clippolyv_dsn = NULL,
  clippolyv.filter = NULL,
  showext = FALSE,
  keepNA = FALSE,
  returnsp = TRUE,
  othertabnms = NULL,
  stopifnotin = TRUE,
  savedata = FALSE,
  exportsp = FALSE,
  spMakeSpatial_opts = NULL,
  savedata_opts = NULL
)
```

## Arguments

xyplt	sf R object or String. Point data to clip. Can be a spatial points object, full pathname to a shapefile, or name of a layer within a database.
xyplt_dsn	String. Data source name (dsn; e.g., sqlite or shapefile pathname) of layer to clip. The dsn varies by driver. See gdal OGR vector formats ( <a href="https://www.gdal.org/ogr_formats.html">https://www.gdal.org/ogr_formats.html</a> ).
uniqueid	String.* Unique identifier of xyplt rows.
clippolyv	sf R object or String. Name of clipping polygon spatial polygon object, full path to shapefile, or name of a layer within a database.
clippolyv_dsn	String. Data source name (dsn; e.g., sqlite or shapefile pathname) of clipping polygon. The dsn varies by driver. See gdal OGR vector formats ( <a href="https://www.gdal.org/ogr_formats.html">https://www.gdal.org/ogr_formats.html</a> ).
clippolyv.filter	String. Filter to subset clippolyv spatial layer.
showext	Logical. If TRUE, layer extents are displayed in plot window.
keepNA	Logical. If TRUE, keep NA values after data intersection.
returnsp	Logical. If TRUE, returns sf object of points. If FALSE, returns data frame of points (i.e., drops sf geometry).

othertabnms	String vector. Name(s) of R objects, comma-delimited files, or database layers to subset. Must include quotes (e.g., othertabnms=c("tree", "cond")).
stopifnotin	Logical. If TRUE, stops if boundaries do not overlap. If FALSE, returns NULL.
savadata	Logical. If TRUE, save data to outfolder.
exportsp	Logical. If TRUE, the clipped spatial point data are exported.
spMakeSpatial_opts	List. See help(spMakeSpatial_options()) for a list of options. Use to convert X/Y values to simple feature (sf) coordinates.
savadata_opts	List. See help(savadata_options()) for a list of options for saving data. If out_layer = NULL, default = 'pntclip'.

### Details

The sf::st\_intersection function is used to clip points.

If the projection of clippolyv is not the same as the xyplt, the xyplt layer will be reprojected to the same projection as the clippoly before intersection.

### Value

A list of the following objects:

clip_xyplt	sf object. The input xyplt, clipped to polygon boundary layer. The projection will be same as clippolyv projection.
xy.uniqueid	String. Unique identifier of clip_xy.
clip_polyv	SpatialPolygonsDataFrame. The polygon boundary layer used for clipping.
clip_tabs	Data frame(s). Other tables in intabs clipped to boundary.

If exportsp=TRUE, the sf object will be written to out\_dsn (See note).

### Note

#### On-the-fly projection conversion

The spTransform (rgdal) method is used for on-the-fly map projection conversion and datum transformation using PROJ.4 arguments. Datum transformation only occurs if the +datum tag is present in the both the from and to PROJ.4 strings. The +towgs84 tag is used when no datum transformation is needed. PROJ.4 transformations assume NAD83 and WGS84 are identical unless other transformation parameters are specified. Be aware, providing inaccurate or incomplete CRS information may lead to erroneous data shifts when reprojecting. See spTransform help documentation for more details.

#### ESRI Shapefile Driver

If exportsp=TRUE:

The writeOGR (rgdal) function is called. If out\_fmt="shp", the ESRI Shapefile driver truncates variable names to 10 characters or less. Variable names are changed before export using an internal function (trunc10shp). If sf object has more than 1 record, it will be returned but not exported.

**Author(s)**

Tracey S. Frescino

**Examples**

```
# Get point data from WYplt data in FIESTA
WYplt <- FIESTA::WYplt

# Get polygon vector layer from FIESTA external data
WYbhdistfn <- system.file("extdata",
                          "sp_data/WYbighorn_districtbnd.shp",
                          package = "FIESTA")

# Extract points from polygon vector layer
xyext <- spClipPoint(xyplt = WYplt,
                    clippolyv = WYbhdistfn,
                    clippolyv.filter = "DISTRICTNU == '03'",
                    uniqueid = "CN",
                    spMakeSpatial_opts = list(xvar = "LON_PUBLIC",
                                              yvar = "LAT_PUBLIC",
                                              xy.crs = 4269))

names(xyext)
xyplt <- xyext$clip_xyplt
polyv <- xyext$clip_polyv

# Plot extracted values of national forest district
plot(sf::st_geometry(polyv))
plot(sf::st_geometry(xyplt), add = TRUE)
```

spClipPoly

*Spatial - Clip (intersect) polygon vector layer with polygon vector layer.*

**Description**

Wrapper for `sf::st_intersection`, to clip (intersect) polygon vector layer with another polygon vector layer.

**Usage**

```
spClipPoly(
  polyv,
  polyv_dsn = NULL,
  clippolyv,
  clippolyv_dsn = NULL,
  clippolyv.filter = NULL,
  showext = FALSE,
  areacalc = FALSE,
  areaunits = "ACRES",
```

```

    nolonglat = TRUE,
    exportsp = FALSE,
    savedata_opts = NULL
  )

```

### Arguments

polyv	sf R object or String. Polygon data to clip. Can be a spatial polygon object, full pathname to a shapefile, or name of a layer within a database.
polyv_dsn	String. Data source name (dsn; e.g., sqlite or shapefile pathname) of layer to clip. The dsn varies by driver. See gdal OGR vector formats ( <a href="https://www.gdal.org/ogr_formats.html">https://www.gdal.org/ogr_formats.html</a> ). Optional if polyv is sf object.
clippolyv	SpatialPolygons class R object or String. Name of the polygon spatial layer to use for clipping.
clippolyv_dsn	String. Data source name (dsn; i.e., pathname or database name) of clippolyv_layer. The dsn varies by driver. See gdal OGR vector formats ( <a href="https://www.gdal.org/ogr_formats.html">https://www.gdal.org/ogr_formats.html</a> ). Optional if clippolyv_layer is an R object.
clippolyv.filter	String. Filter to subset clippolyv spatial layer.
showext	Logical. If TRUE, layer extents are displayed in plot window.
areacalc	Logical. If TRUE, calculate area of clipped polygons and append to attribute table (See details).
areaunits	String. If TRUE, calculate area of clipped polygons and append to attribute table ("ACRES", "HECTARES", "SQKM"). If NULL, units of polyv.
nolonglat	Logical. If TRUE, and both layer's coordinate system is long/lat, the layers are converted to a projected CRS before clipping.
exportsp	Logical. If TRUE, the spatial clipped object is exported to outfolder (see spExportSpatial for details).
savedata_opts	List. See <code>help(savedata_options())</code> for a list of options for saving data. If <code>out_layer = NULL</code> , default = 'polyclip'.

### Details

The `sf::st_intersection` function is used to clip polygons.

#### areacalc

If `areacalc = TRUE` and the clipped spatial object is not in a projected coordinate system (i.e., longlat), the object will be reprojected to the Albers Equal Area projection before area is calculated.

### Value

sf object of clipped polygon. If `polyv` and `clippolyv` have different projections, the projection of returned object will have the same projection as `polyv` (See note about on-the-fly projection conversion).

If `exportsp=TRUE`, the sf object will be written to outfolder (See note).

**Note****On-the-fly projection conversion**

The spTransform (rgdal) method is used for on-the-fly map projection conversion and datum transformation using PROJ.4 arguments. Datum transformation only occurs if the +datum tag is present in the both the from and to PROJ.4 strings. The +towgs84 tag is used when no datum transformation is needed. PROJ.4 transformations assume NAD83 and WGS84 are identical unless other transformation parameters are specified. Be aware, providing inaccurate or incomplete CRS information may lead to erroneous data shifts when reprojecting. See spTransform help documentation for more details.

**ESRI Shapefile Driver**

If exportsp=TRUE:

The writeOGR (rgdal) function is called. If out\_fmt="shp", the ESRI Shapefile driver truncates variable names to 10 characters or less. Variable names are changed before export using an internal function (trunc10shp). If sf object has more than 1 record, it will be returned but not exported.

**Author(s)**

Tracey S. Frescino

**Examples**

```
## Not run:
# Load in USAco data from raster package
USAco <- raster::getData("GADM", country = "USA", level = 2)

# Set up data from FIESTA
WYbh <- spImportSpatial(system.file("extdata",
                                   "sp_data/WYbighorn_adminbnd.shp",
                                   package = "FIESTA"))

# Clip polygon with WY Bighorn object from FIESTA
WYbhco <- spClipPoly(polyv = USAco,
                    clippolyv = WYbh)

## End(Not run)
```

---

spClipRast

*Spatial - Subsets a raster to a polygon extent or boundary.*

---

**Description**

Subsets a raster to the extent or masked boundary of a spatial polygon object or shapefile (\*.shp), with option to write the new file to the outfolder with specified format (fmt).

**Usage**

```

spClipRast(
  rast,
  rastfolder = NULL,
  clippolyv,
  clippolyv_dsn = NULL,
  clippolyv.filter = NULL,
  rast.crs = NULL,
  bands = NULL,
  NODATA = NULL,
  buffdist = NULL,
  maskByPolygons = TRUE,
  showext = FALSE,
  fmt = "HFA",
  compress = NULL,
  outfolder = NULL,
  outfn = "rastclip",
  outfn.pre = NULL,
  outfn.date = FALSE,
  overwrite = FALSE
)

```

**Arguments**

<code>rast</code>	String or Raster. Raster name, including extension. Option to include full path.
<code>rastfolder</code>	String. Name of the raster folder. Optional.
<code>clippolyv</code>	SpatialPolygons class R object or String. Name of the polygon spatial layer to use for clipping.
<code>clippolyv_dsn</code>	String. The data source name (dsn; i.e., pathname or database name) of clip-polyv. The dsn varies by driver. See gdal OGR vector formats ( <a href="https://www.gdal.org/ogr_formats.html">https://www.gdal.org/ogr_formats.html</a> ). Optional if <code>polyv_layer</code> is an R object.
<code>clippolyv.filter</code>	String. Filter to subset <code>clippolyv</code> spatial layer.
<code>rast.crs</code>	EPSG code or PROJ.4 string. Defined coordinate reference system if <code>rast</code> has no crs defined.
<code>bands</code>	Numeric vector. If <code>rast</code> is a multi-layer raster and only 1 or some layers are desired, specify layer number(s) in a vector format. If <code>NULL</code> , all layers are summed.
<code>NODATA</code>	Number. The <code>NODATA</code> value for background values. If <code>NODATA</code> is <code>NULL</code> , and a <code>NODATA</code> value is defined on the input raster, the default is the defined <code>NODATA</code> value, else it is defined based on its datatype (see <code>DEFAULT_NODATA</code> for default data values).
<code>buffdist</code>	Number. The distance to buffer the polygon before clipping raster, in units of raster.
<code>maskByPolygons</code>	Logical. If <code>TRUE</code> , <code>rast</code> is clipped to boundary of polygon. If <code>FALSE</code> , <code>rast</code> is clipped to extent of polygon.

showext	Logical. If TRUE, layer extents are displayed in plot window.
fmt	String. Format for exported raster. Default is format of unput raster. ("raster", "ascii", "SAGA", "IDRISI", "CDF", "GTiff", "ENVI", "EHdr", "HFA", "VRT"). VRT is a virtual raster (See note below).
compress	String. An optional compression type ('LZW', "DEFLATE", "PACKBITS").
outfolder	String. The output folder.
outfn	String. Name of output data file. If NULL, default is 'rastclip'. If no extension, a default is provided to match output format.
outfn.pre	String. Add a prefix to output name (e.g., "01").
outfn.date	Logical. If TRUE, add date to end of outfile (e.g., outfn_'date'.csv).
overwrite	Logical. If TRUE, overwrite files in outfolder.

### Details

Use spClipRast() to prompt for input.

If the projection of polyv is different than the projection of rast, the polyv SpatialPolygons object is converted to the projection of rast (See note about on-the-fly projection conversion).

### Value

value                Spatial S4 object. A clipped raster file.

The clipped raster is written to outfolder with specified format or same format as input raster.

### Note

#### On-the-fly projection conversion

The spTransform (rgdal) method is used for on-the-fly map projection conversion and datum transformation using PROJ.4 arguments. Datum transformation only occurs if the +datum tag is present in the both the from and to PROJ.4 strings. The +towgs84 tag is used when no datum transformation is needed. PROJ.4 transformations assume NAD83 and WGS84 are identical unless other transformation parameters are specified. Be aware, providing inaccurate or incomplete CRS information may lead to erroneous data shifts when reprojecting. See spTransform help documentation for more details.

VRT format Virtual raster format is a pointer to a temporary file, commonly used as an intermediate step between processes. The VRT format ignores option to maskByPolygons.

### Examples

```
# Get polygon vector layer from FIESTA external data
WYbhdistfn <- system.file("extdata",
                        "sp_data/WYbighorn_districtbnd.shp",
                        package = "FIESTA")
```

```

WYbhdist <- FIESTA::spImportSpatial(WYbhdistfn)
WYbhdist

# Get raster layers from FIESTA external data
demfn <- system.file("extdata",
                    "sp_data/WYbighorn_dem_250m.img",
                    package = "FIESTA")
raster::plot(raster::raster(demfn))

# Clip raster to district = '03'
dem03 <- spClipRast(rast = demfn,
                  clippolyv = WYbhdistfn,
                  clippolyv.filter = "DISTRICTNU == '03'",
                  overwrite = TRUE,
                  outfolder = tempdir())
raster::plot(raster::raster(dem03))

# Clip raster to district = '06'
dem06 <- spClipRast(rast = demfn,
                  clippolyv = WYbhdistfn,
                  clippolyv.filter = "DISTRICTNU == '06'",
                  overwrite = TRUE,
                  outfolder = tempdir())

# Plot extracted values of national forest district
raster::plot(raster::raster(dem06))

```

---

spExportSpatial

*Spatial - Exports an sf object.*

---

## Description

Exports an sf object to a specified output.

## Usage

```
spExportSpatial(sfobj, savedata_opts = NULL)
```

## Arguments

**sfobj** sf class R object. Spatial object to export.

**savedata\_opts** List. See `help(savedata_options())` for a list of options for saving data. If `out_layer = NULL`, default = 'datasp'.

## Details

Wrapper for `sf::st_write` function.

**Value**

An sf spatial object is written to outfolder.

**Note**

If `out_fmt='shp'`:

The ESRI shapefile driver truncates variable names to 10 characters or less. Variable names are changed before export using an internal function (`trunc10shp`). Name changes are output to the outfolder, `'out_layer'_newnames.csv`.

If sf object has more than 1 record, it cannot be exported to a shapefile.

**Author(s)**

Tracey S. Frescino

**Examples**

```
# Set up data from FIESTA
WYbh <- spImportSpatial(system.file("extdata",
                                   "sp_data/WYbighorn_adminbnd.shp",
                                   package = "FIESTA"))

# Export data with spExportSpatial
spExportSpatial(WYbh,
                savedata_opts = list(out_dsn = "WYbh.shp",
                                     outfolder = tempdir(),
                                     overwrite_dsn = TRUE))
```

---

spExtractPoly

*Spatial - Extracts point attribute values from SpatialPolygons layer(s).*

---

**Description**

Extracts values from one or more polygon layers and appends to input SpatialPoints layer or data frame. Points are reprojected on-the-fly to projection of SpatialPolygons using PROJ.4 transformation parameters and `rgdal::spTransform` function.

**Usage**

```
spExtractPoly(
  xyplt,
  xyplt_dsn = NULL,
  xy.uniqueid = "PLT_CN",
  polyvlst,
  polyv_dsn = NULL,
  polyvarlst = NULL,
  polyvarnmlst = NULL,
```

```

keepNA = FALSE,
showext = FALSE,
savedata = FALSE,
exportsp = FALSE,
exportNA = FALSE,
spMakeSpatial_opts = NULL,
savedata_opts = NULL,
gui = FALSE
)

```

### Arguments

xyplt	Data frame object or String. Name of layer with xy coordinates and unique identifier. Can be layer with xy_dsn, full pathname, including extension, or file name (with extension) in xy_dsn folder.
xyplt_dsn	String. Name of database where xyplt is. The dsn varies by driver. See gdal OGR vector formats ( <a href="https://www.gdal.org/ogr_formats.html">https://www.gdal.org/ogr_formats.html</a> ).
xy.uniqueid	String.* Unique identifier of xyplt rows.
polyvlst	sf R object or String. Name(s) of polygon layers to extract values. A spatial polygon object, full path to shapefile, or name of a layer within a database.
polyv_dsn	String. Data source name (dsn) where polyvlst layers are found (e.g., *.sqlite, *.gdb, folder name). The dsn varies by driver. See gdal OGR vector formats ( <a href="https://www.gdal.org/ogr_formats.html">https://www.gdal.org/ogr_formats.html</a> ).
polyvarlst	String vector or list. The name(s) of variable(s) to extract from polygon(s). If extracting multiple variables from more than one polygon, specify names in a list format, corresponding to polyvlst.
polyvarnmlst	String vector or list. Output name(s) of variable(s) extracted from polygon(s). If extracting multiple variables from more than one polygon, specify names in a list format, corresponding to polyvlst. The number of names must match the number of variables in polyvarlst.
keepNA	Logical. If TRUE, keep NA values.
showext	Logical. If TRUE, layer extents are displayed in plot window.
savedata	Logical. If TRUE, the input data with extracted values are saved to outfolder.
exportsp	Logical. If TRUE, the extracted point data are exported to outfolder.
exportNA	Logical. If TRUE, NULL values are exported to outfolder.
spMakeSpatial_opts	List. See <code>help(spMakeSpatial_options())</code> for a list of options. Use to convert X/Y values to simple feature (sf) coordinates.
savedata_opts	List. See <code>help(savedata_options())</code> for a list of options. Only used when savedata = TRUE. If out_layer = NULL, default = 'polyext'.
gui	Logical. If gui, user is prompted for parameters.

**Details**

\*If variable = NULL, then it will prompt user for input.

keepnull

If keepnull=FALSE, points are excluded when all extracted variables from any one SpatialPolygons are NULL, returning the points that fall within the ' intersecting polygons.

**Value**

pltdat                SpatialPointsDataFrame object or data frame. Input point data with extracted raster values appended. For multi-part polygons, more than 1 row per point may be output.

var.name             String vector. Variable names of extracted variables.

If savedata=TRUE, outdat data frame is saved to outfolder (Default name: datext\_'date'.csv). If exportsp=TRUE, the SpatialPointsDataFrame object is exported to outfolder (Default name: datext\_'date'.shp). Variable names are truncated to 10 characters or less (See note below). Name changes are output to 'outfn'\_newnames\_'data'.csv in outfolder.

**Note**

If exportshp=TRUE:

The writeOGR (rgdal) function is called. The ArcGIS driver truncates variable names to 10 characters or less. Variable names are changed before export using an internal function (trunc10shp). If Spatial object has more than 1 record, it will be returned but not exported.

The spTransform (rgdal) method is used for on-the-fly map projection conversion and datum transformation using PROJ.4 arguments. Datum transformation only occurs if the +datum tag is present in the both the from and to PROJ.4 strings. The +towgs84 tag is used when no datum transformation is needed. PROJ.4 transformations assume NAD83 and WGS84 are identical unless other transformation parameters are specified. Be aware, providing inaccurate or incomplete CRS information may lead to erroneous data shifts when reprojecting. See spTransform help documentation for more details.

Any names in polygon layers that are the same as in xyplt are renamed to name'\_1'.

**Author(s)**

Tracey S. Frescino

**Examples**

```
# Get point data from WYplt data in FIESTA
WYplt <- FIESTA::WYplt

# Get polygon vector layer from FIESTA external data
WYbhdistfn <- system.file("extdata",
                          "sp_data/WYbighorn_districtbnd.shp",
                          package = "FIESTA")

# Extract points from polygon vector layer
xyext <- spExtractPoly(xyplt = WYplt,
```

```

polyv1st = Wybhdistfn,
xy.uniqueid = "CN",
spMakeSpatial_opts = list(xvar = "LON_PUBLIC",
                           yvar = "LAT_PUBLIC",
                           xy.crs = 4269))

names(xyext)
xyext$outnames
spxyext <- xyext$spxyext
head(spxyext)
NA1st <- xyext$NA1st

# Plot extracted values of national forest district
plot(spxyext["DISTRICTNU"])

```

---

spExtractRast

*Spatial - Extracts point attribute values from raster layer(s).*

---

### Description

Extracts values from one or more raster layers and appends to input SpatialPoints layer or data frame. Points are reprojected on-the-fly to projection of raster(s) using PROJ.4 transformation parameters and rgdal spTransform function. Includes options to use bilinear interpolation or summarize over a window of n pixels using a specified statistic.

### Usage

```

spExtractRast(
  xyplt,
  xyplt_dsn = NULL,
  xy.uniqueid = "PLT_CN",
  rastlst,
  rastfolder = NULL,
  rast.crs = NULL,
  bandlst = NULL,
  var.name = NULL,
  interpolate = FALSE,
  windowsize = 1,
  windowstat = NULL,
  rast.NODATA = NULL,
  keepNA = TRUE,
  ncores = 1,
  showext = FALSE,
  savedata = FALSE,
  exportsp = FALSE,
  exportNA = FALSE,
  spMakeSpatial_opts = NULL,
  savedata_opts = NULL,
  gui = FALSE
)

```

**Arguments**

xyplt	Data frame object or String. Name of layer with xy coordinates and unique identifier. Can be layer with xy_dsn, full pathname, including extension, or file name (with extension) in xy_dsn folder.
xyplt_dsn	String. Name of database where xyplt is. The dsn varies by driver. See gdal OGR vector formats ( <a href="https://www.gdal.org/ogr_formats.html">https://www.gdal.org/ogr_formats.html</a> ).
xy.uniqueid	String. Unique identifier of xyplt rows.
rastlst	String vector or list of strings and/or rasters. File name(s) with extensions, or raster object(s). Note: raster objects must be written to file.
rastfolder	String. Name of the folder with raster layers. Optional. Useful if all raster layers are in same folder.
rast.crs	EPSG code or PROJ.4 String. Name of coordinate reference system for rasters with no projection defined. If more than one raster has no projection defined, the same crs will be used.
bandlst	Numeric named list. If rastfnlst includes a multi-layer raster and only 1 or some layers are desired, specify layer numbers in a named list format with names matching the base names in rastfnlst (e.g., list(rast1=5, rast3=1:3)). If NULL, all layers are extracted.
var.name	String vector. Extracted variable name(s). If NULL, uses the basename of raster layer, including band number for multi-band rasters.
interpolate	Logical vector. If TRUE, uses bilinear interpolation of pixel values, weighted average of 4 nearest pixels (i.e., continuous data).
window size	Number vector. The size of window for summarizing data.
windowstat	Character vector. If window size is greater than one, the statistic to use for summarizing data ("mean", "min", "max", "median", "sum", "range", "var", "sd", "rsd", "mode", "value"). If windowstat="value", all pixel values are returned, otherwise 1 value per row in xyplt is returned.
rast.NODATA	Numeric vector. NODATA value(s) of raster if not predefined (See notes below). This value will be converted to NA and removed if keepNA=FALSE. If rastfnlst includes more than one raster, the rast.NODATA value should coincide with number of rasters in rastfnlst. If only one rast.NODATA, the same NODATA value is used for all rasters.
keepNA	Logical. If TRUE, keeps NA values after data extraction.
ncores	Integer. Number of cores to use for extracting values.
showext	Logical. If TRUE, layer extents are displayed in plot window.
savedata	Logical. If TRUE, the input data with extracted values are saved to outfolder.
exportsp	Logical. If TRUE, the extracted raster point data are exported to outfolder.
exportNA	Logical. If TRUE, NA values are exported to outfolder.
spMakeSpatial_opts	List. See help(spMakeSpatial_options()) for a list of options. Use to convert X/Y values to simple feature (sf) coordinates.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE. If out_layer = NULL, default = 'rastext'.
gui	Logical. If gui, user is prompted for parameters.

**Details**

\*If variable = NULL, then it will prompt user for input.

**Value**

sppltext	sf object or data frame. Input xyplt data with extracted raster values appended.
outnames	String vector. Raster output names.
rastfnlst	String vector. Raster pathnames.
inputdf	Data frame. Raster information input to zonal summaries.
NA1st	sf List. If NA values exist after data extraction, the spatial NA points are returned.

If savedata=TRUE, pltassgn and unitarea are saved to outfolder.

If exportsp=TRUE, the spatial sf points object is exported to outfolder.

. If exportNA=TRUE and NA values exist after data extraction, the spatial NA points are exported to outfolder.

**Note**

rast.NODATA

NODATA values are raster pixel values that have no data of interest, including pixels within the extent of the layer, but outside the area of interest. Sometimes these pixels have been defined previously. The defined NODATA pixels are imported to R as NULL values. When not previously defined, the pixels outside the area of interest will be the minimum or maximum value depending on the data type (e.g., 16-bit signed: min=-32,768; max=32,768) or byte size (1 byte: min=0; max=255). These NODATA values will be added to the zonal statistic calculations if not specified in rast.NODATA.

The spTransform (rgdal) method is used for on-the-fly map projection conversion and datum transformation using PROJ.4 arguments. Datum transformation only occurs if the +datum tag is present in the both the from and to PROJ.4 strings. The +towgs84 tag is used when no datum transformation is needed. PROJ.4 transformations assume NAD83 and WGS84 are identical unless other transformation parameters are specified. Be aware, providing inaccurate or incomplete CRS information may lead to erroneous data shifts when reprojecting. See spTransform help documentation for more details.

plot(spplttext["fornf"])

# Plot extracted values of dem (i.e., elevation)
plot(spplttext["dem"])

```

---

spGetAuxiliary

*Spatial wrapper - Extracts and compiles auxiliary data within a specified boundary.*

---

## Description

Wrapper to extract and compile auxiliary data by domain unit (i.e, estimation unit or small area domain). The following information is compiled:

- Attribute defining domain (i.e., estimation unit) from domain layer
- Area by domain (i.e., estimation unit)
- Zonal statistics by domain (i.e., estimation unit) - spZonalRast()

## Usage

```

spGetAuxiliary(
  xyplt = NULL,
  xyplt_dsn = NULL,
  uniqueid = "PLT_CN",
  unittype = "POLY",
  unit_layer = NULL,
  unit_dsn = NULL,
  unitvar = NULL,
  rastlst.cont = NULL,
  rastlst.cont.name = NULL,
  rastlst.cont.stat = "mean",

```

```

rastlst.cont.NODATA = NULL,
rastlst.cat = NULL,
rastlst.cat.name = NULL,
rastlst.cat.NODATA = NULL,
rastfolder = NULL,
asptransform = FALSE,
rast.asp = NULL,
rast.lut = NULL,
rastlut = NULL,
extract = TRUE,
areacalc = TRUE,
areaunits = "ACRES",
keepNA = TRUE,
ncores = 1,
NAt00 = TRUE,
npixels = TRUE,
addN = FALSE,
showext = FALSE,
returnxy = FALSE,
savedata = FALSE,
exportsp = FALSE,
exportNA = FALSE,
spMakeSpatial_opts = NULL,
savedata_opts = NULL,
vars2keep = NULL,
gui = FALSE
)

```

### Arguments

xyplt	Data frame object or String. Name of layer with xy coordinates and unique identifier. Can be layer with xy_dsn, full pathname, including extension, or file name (with extension) in xy_dsn folder.
xyplt_dsn	String. Name of database where xyplt is. The dsn varies by driver. See gdal OGR vector formats ( <a href="https://www.gdal.org/ogr_formats.html">https://www.gdal.org/ogr_formats.html</a> ).
uniqueid	String.* Unique identifier of xyplt records.
unittype	String. Type of spatial layer unit_layer is ("POLY", "RASTER").
unit_layer	sf R object or String. Name of the domain spatial layer. Can be a spatial polygon object, full pathname to a shapefile, name of a polygon layer within a database, or a full pathname to raster file.
unit_dsn	String. The data source name (dsn; i.e., folder or database name) of unit_layer. The dsn varies by driver. See gdal OGR vector formats ( <a href="https://www.gdal.org/ogr_formats.html">https://www.gdal.org/ogr_formats.html</a> ). Optional.
unitvar	String. Name of domain variable in domlayer. If NULL, assuming one domain. An attribute names ONEUNIT is added to layer with value=1.
rastlst.cont	String vector or list. A list of raster(s) with continuous data values (e.g., DEM).

The list may include file name of raster(s) or raster objects that are not InMemory.

rastlst.cont.name	String vector. Output names for continuous rasters. Optional. If NULL, name of raster is used as default or name+'_'+layer number for multi-band layers.
rastlst.cont.stat	String. Zonal statistic for continuous rasters.
rastlst.cont.NODATA	Numeric vector. NODATA value for continuous rasters (See notes). These values will be converted to NA and removed from output if keepNA=FALSE. If 1 number, the same value will be used for all categorical rasters. If more than 1 number, the number of values must be equal to the number of rasters in rastlst.cont.
rastlst.cat	String vector or list. A list of raster(s) with thematic (i.e., categorical) data values. The list may include file name of raster(s) or raster objects that are not InMemory.
rastlst.cat.name	String vector. Output names for categorical rasters. If NULL, name of raster is used as default or name+'_'+layer number for multi-band layers.
rastlst.cat.NODATA	Numeric vector. NODATA value for categorical rasters (See notes). These values will be converted to NA and removed from output if keepNA=FALSE. If 1 number, the same value will be used for all categorical rasters. If more than 1 number, the number of values must be equal to the number of rasters in rastlst.cat.
rastfolder	String. Name of the folder with raster layers. Optional. Useful if all raster layers are in same folder.
aspttransform	Logical. If TRUE, transforms aspect to Northness and Eastness indices using sin and cosine functions.
rast.asp	String or raster object. The raster in rastlst.cont that is the aspect raster (Note: aspect must have units in degrees).
rast.lut	String. A raster in rastlst.cat to group class values. Only one raster is allowed.
rastlut	String or raster object. The raster look up table used for collapsing rast.lut values.
extract	Logical. If TRUE, extracts values from rastlst.cont and rastlst.cat along with values from unit_layer. If FALSE, extracts only values from unit_layer.
areacalc	Logical. If TRUE, returns area by domvar.
areaunits	String. Output area units ("ACRES", "HECTARES", "SQMETERS").
keepNA	Logical. If TRUE, returns data frame of NA values.
ncores	Integer. Number of cores to use for extracting values.
NAto0	Logical. If TRUE, converts extracted NA values to 0.
npixels	Logical. If TRUE, include number of pixels.
addN	Logical. If TRUE, adds N to unitzonal output with number of plots by unit.

showext	Logical. If TRUE, layer extents are displayed in plot window.
returnxy	Logical. If TRUE, returns xy data as sf object (spxyplt).
savadata	Logical. If TRUE, the input data with extracted values are saved to outfolder.
exportsp	Logical. If savadata=TRUE and returnxy=TRUE, If TRUE, the extracted strata point data are exported to outfolder.
exportNA	Logical. If TRUE, NA values are exported to outfolder.
spMakeSpatial_opts	List. See help(spMakeSpatial_options()) for a list of options. Use to convert X/Y values to simple feature (sf) coordinates.
savadata_opts	List. See help(savadata_options()) for a list of options. Only used when savadata = TRUE.
vars2keep	String vector. Attributes in SAdoms, other than domvar to include in unitzonal output and extract to pltassgn points.
gui	Logical. If gui, user is prompted for parameters.

### Details

\*If variable = NULL, then it will prompt user for input.

If there is a raster and SpatialPolygon layer, and the projection of the SpatialPolygons is different than the projection of the raster, the SpatialPolygons object is reprojected to the projection of raster (See note about on-the-fly projection conversion).

### Value

pltassgn	sf object. xyplt data with extracted values from rastlst*.
unitzonal	Data frame. Number of pixels and zonal statistics from continuous rasters or zonal proportions from categorical raster for each domain (i.e., estimation unit).
unitvar	Data frame. Domain (i.e., estimation unit) name.
inputdf	Data frame. Raster information input to zonal summaries.
prednames	String vector. Name(s) of predictor variable(s).
zonalnames	String vector. Name(s) of zonal variable(s).
predfac	String vector. Name(s) of categorical (i.e. factor) variable(s).
npixelvar	String. Name of variable describing number of pixels.
unitarea	Data frame. Area by domain (i.e., estimation unit).
areavar	String. Name of variable describing acres in domarea.
pltassgnid	String. Unique identifier of plot.
spxy	Simple feature. If returnxy=TRUE, Spatial coordinates.
xy.uniqueid	String. If returnxy=TRUE, unique identifier of spxy.

If savadata=TRUE, datstrat and unitarea are saved to outfolder. If exportsp=TRUE, the sf object is exported to outfolder.

**Note**

rast.NODATA

NODATA values are raster pixel values that have no data of interest, including pixels within the extent of the layer, but outside the area of interest. Sometimes these pixels have been defined previously. The defined NODATA pixels are imported to R as NULL values. When not previously defined, the pixels outside the area of interest will be the minimum or maximum value depending on the data type (e.g., 16-bit signed: min=-32,768; max=32,768) or byte size (1 byte: min=0; max=255). These NODATA values will be added to the zonal statistic calculations if not specified in rast.NODATA.

If exportsp=TRUE:

If out\_fmt="shp", the writeOGR (rgdal) function is called. The ArcGIS driver truncates variable names to 10 characters or less. Variable names are changed before export using an internal function (trunc10shp). If Spatial object has more than 1 record, it will be returned but not exported.

On-the-fly projection conversion

The spTransform (rgdal) method is used for on-the-fly map projection conversion and datum transformation using PROJ.4 arguments. Datum transformation only occurs if the +datum tag is present in the both the from and to PROJ.4 strings. The +towgs84 tag is used when no datum transformation is needed. PROJ.4 transformations assume NAD83 and WGS84 are identical unless other transformation parameters are specified. Be aware, providing inaccurate or incomplete CRS information may lead to erroneous data shifts when reprojecting. See spTransform help documentation for more details.

Tracey S. Frescino

**Examples**

```
# Get layers from FIESTA external data
## dem (continuous)
demfn <- system.file("extdata",
                     "sp_data/WYbighorn_dem_250m.img",
                     package = "FIESTA")

## tnt (categorical)
tntfn <- system.file("extdata",
                     "sp_data/WYbighorn_forest_nonforest_250m.tif",
                     package = "FIESTA")

## unit layer
WYbhdistfn <- system.file("extdata",
                          "sp_data/WYbighorn_districtbnd.shp",
                          package = "FIESTA")

# Get Auxiliary data
spGetAuxiliary(xyplt = FIESTA::WYplt,
               uniqueid = "CN",
               unit_layer = WYbhdistfn,
               unitvar = "DISTRICTNA",
               rastlst.cont = demfn,
```

```
rastlst.cat = tntfn,
spMakeSpatial_opts = list(xvar = "LON_PUBLIC",
                          yvar = "LAT_PUBLIC"))
```

---

spGetEstUnit	<i>Spatial wrapper - Extracts point attribute values and area from a simple feature or raster estimation unit layer.</i>
--------------	--

---

### Description

Wrapper to get point attribute values and area from a simple feature or raster layer of estimation units and calculates area. Points are reprojected on-the-fly to projection of unit\_layer using PROJ.4 transformation parameters and rgdal spTransform function. - Point attribute extraction from simple feature (spExtractPoly) or from raster (spExtractRast) - Calculate area by estimation unit(s) (areacalc.poly/areacalc.pixel)

### Usage

```
spGetEstUnit(
  xyplt,
  xyplt_dsn = NULL,
  uniqueid = "PLT_CN",
  unittype = "POLY",
  unit_layer,
  unit_dsn = NULL,
  unitvar = NULL,
  unit.filter = NULL,
  areavar = NULL,
  areaunits = "acres",
  keepNA = FALSE,
  returnxy = FALSE,
  showext = FALSE,
  savedata = FALSE,
  exportsp = FALSE,
  exportNA = FALSE,
  spMakeSpatial_opts = NULL,
  savedata_opts = NULL,
  vars2keep = NULL,
  gui = FALSE
)
```

### Arguments

xyplt	Data frame, sf object, full pathname to *.csv or *.shp, or layer name in a geodatabase. Includes XY coordinates and unique identifier. If non-spatial, include options in spMakeSpatial_opts parameter.
-------	---

xyplt_dsn	String. Name of database where xyplt is. The dsn varies by driver. See gdal OGR vector formats ( <a href="https://www.gdal.org/ogr_formats.html">https://www.gdal.org/ogr_formats.html</a> ).
uniqueid	String.* Unique identifier of xyplt rows.
unittype	String. Spatial layer type of unit_layer ("POLY", "RASTER").
unit_layer	String or sf object. The name of the estimation unit layer. The layer name may be a full pathname to a file, the basename to a file, a spatial layer name from a database, or a SpatialPolygons object with a defined projection.
unit_dsn	String. The data source name (dsn; i.e., folder or database name) of unit_layer. The dsn varies by driver. See gdal OGR vector formats ( <a href="https://www.gdal.org/ogr_formats.html">https://www.gdal.org/ogr_formats.html</a> ). Optional.
unitvar	String. Name of estimation unit variable in unit_layer.
unit.filter	String. Filter to subset unit_layer spatial layer.
areavar	String. Name of area variable unit variable in unit_layer. If NULL, calculates area by unitvar.
areaunits	String. Output area units ("acres", "hectares", "sqmeters").
keepNA	Logical. If TRUE, returns data frame of NA values.
returnxy	Logical. If TRUE, returns xy data as sf object (spxyplt).
showext	Logical. If TRUE, layer extents are displayed in plot window.
savedata	Logical. If TRUE, the input data with extracted values are saved to outfolder.
exportsp	Logical. If TRUE, the extracted strata point data are exported to outfolder.
exportNA	Logical. If TRUE, NA values are exported to outfolder.
spMakeSpatial_opts	List. See <code>help(spMakeSpatial_options())</code> for a list of options. Use to convert X/Y values to simple feature (sf) coordinates.
savedata_opts	List. See <code>help(savedata_options())</code> for a list of options. Only used when <code>savedata = TRUE</code> .
vars2keep	String vector. Attributes in SAdoms, other than domvar to include in dunitlut output and extract to pltassgn points.
gui	Logical. If gui, user is prompted for parameters.

### Details

\*If variable = NULL, then it will prompt user for input.

If there is a raster and simple feature layer, and the projection of the simple feature is different than the projection of the raster, the simple feature object is transformed to the projection of raster (See note about on-the-fly projection conversion).

### Value

pltunit	Data frame. Input point data with extracted estimation unit and strata values appended.
sppltunit	SpatialPointsDataframe. Spatial point data with extracted estimation unit values appended.

unitarea	Data frame. Area by estimation unit.
unitvar	Data frame. Variable name for estimation unit in unitarea.
acrevar	Data frame. Variable name for area in unitarea.
pltassgnid	String. Unique identifier of plot.

If savedata=TRUE, pltstrat and unitarea are saved to outfolder (Default name: \*\_date'.csv). If exportshp=TRUE, the SpatialPointsDataFrame object is exported to outfolder (Default name: da-text\_date'.shp). Variable names are truncated to 10 characters or less (See note below). Name changes are output to 'outfn'\_newnames\_'data'.csv in outfolder.

### Note

If exportshp=TRUE:

If out\_fmt="shp", the writeOGR (rgdal) function is called. The ArcGIS driver truncates variable names to 10 characters or less. Variable names are changed before export using an internal function (trunc10shp). If Spatial object has more than 1 record, it will be returned but not exported.

On-the-fly projection conversion

The spTransform (rgdal) method is used for on-the-fly map projection conversion and datum transformation using PROJ.4 arguments. Datum transformation only occurs if the +datum tag is present in the both the from and to PROJ.4 strings. The +towgs84 tag is used when no datum transformation is needed. PROJ.4 transformations assume NAD83 and WGS84 are identical unless other transformation parameters are specified. Be aware, providing inaccurate or incomplete CRS information may lead to erroneous data shifts when reprojecting. See spTransform help documentation for more details.

unitarea

Area by estimation unit is calculated and returned as object named unitarea. Area is based on the projection of unit\_layer. If no unit\_layer input, than area is calculated from pixel counts.

### Author(s)

### Examples

```
# Set up data from FIESTA
WYbhfn <- system.file("extdata",
                     "sp_data/WYbighorn_adminbnd.shp",
                     package = "FIESTA")

# Create a `SpatialPoints` object from `WYplt`
WYspplt <- spMakeSpatialPoints(xyplt = WYplt,
                              xy.uniqueid = "CN",
                              xvar = "LON_PUBLIC",
                              yvar = "LAT_PUBLIC",
                              xy.crs = 4269)

# Get estimation unit acres for Bighorn National Forest
spGetEstUnit(xyplt = WYplt,
             uniqueid = "CN",
             unit_layer = WYbhfn,
```

```
spMakeSpatial_opts = list(xvar = "LON_PUBLIC",
                           yvar = "LAT_PUBLIC",
                           prj = "longlat",
                           datum = "NAD83"))
```

---

spGetPlots

*Spatial wrapper - Extracts plot data within a given boundary.*

---

### Description

Wrapper to get FIA plots within the boundary population (area of interest) - Intersect with state boundary - Get FIA plots for intersected states, including tree, and spatial - Clip spatial coordinates and other tables to boundary (spClipPoint)

### Usage

```
spGetPlots(
  bnd = NULL,
  bnd_dsn = NULL,
  bnd.filter = NULL,

  issubp = FALSE,
  ischng = FALSE,
  isdwm = FALSE,
  biojenk = FALSE,
  greenwt = FALSE,
  plotgeom = FALSE,
  othertables = NULL,
  ACI = FALSE,
  clipxy = TRUE,
```

```

    pjoinid = NULL,
    showsteps = FALSE,
    returndata = TRUE,
    savedata = FALSE,
    savePOP = FALSE,
    savebnd = FALSE,
    returnxy = TRUE,
    exportsp = FALSE,
    savedata_opts = NULL,
    spXYdat = NULL,
    gui = FALSE,
    ...
)

```

### Arguments

<code>bnd</code>	sf R object, Area of Interest (AOI) boundary. Can be a spatial sf object, full pathname to a shapefile, or name of a layer within a database.
<code>bnd_dsn</code>	String. Data source name (dsn; e.g., SQLite database or shapefile pathname) of <code>bnd</code> . The dsn varies by driver. See gdal OGR vector formats ( <a href="https://www.gdal.org/ogr_formats.html">https://www.gdal.org/ogr_formats.html</a> ). Optional if <code>bnd</code> is an R object.
<code>bnd.filter</code>	String. Filter to subset <code>bnd</code> spatial layer.
<code>states</code>	String. The name of state(s) for tables (e.g., "Vermont", "Utah").
<code>RS</code>	String. Name of FIA research station to restrict states to ('RMRS', 'SRS', 'NCRS', 'NERS', 'PNWRS'). If NULL, all research stations are included.
<code>pltids</code>	Data frame. Non-spatial plot identifiers within <code>bnd</code> .
<code>xy_datsource</code>	String. Source of XY data ("obj", "csv", "datamart", "sqlite"). If <code>datsource=NULL</code> , checks extension of <code>xy_dsn</code> or <code>xy</code> to identify <code>datsource</code> .
<code>xy_dsn</code>	String. Data source name (dsn; i.e., pathname or database name) of <code>xy</code> . The dsn varies by driver. See gdal OGR vector formats ( <a href="https://www.gdal.org/ogr_formats.html">https://www.gdal.org/ogr_formats.html</a> ). Optional if <code>bnd_layer</code> is an R object.
<code>xy</code>	sf R object or String. Table with <code>xy</code> coordinates. Can be a spatial polygon object, data frame, full pathname to a shapefile, or name of a layer within a database.
<code>xy_opts</code>	List of <code>xy</code> data options to specify if <code>xy</code> is NOT NULL. See <code>xy_options</code> (e.g., <code>xy_opts = list(xvar='LON', yvar='LAT')</code> ).
<code>datsource</code>	String. Source of FIA data ("obj", "csv", "datamart", "sqlite"). If <code>datsource="sqlite"</code> , specify database name in <code>data_dsn</code> and layers in <code>*_layer</code> arguments. If <code>datsource="datamart"</code> , files are downloaded and extracted from FIA DataMart ( <a href="http://apps.fs.usda.gov/fia/data">http://apps.fs.usda.gov/fia/data</a> ). See details for more information about plot coordinates. If <code>datsource="csv"</code> , specify <code>*.csv</code> file names in <code>*_layer</code> arguments.
<code>data_dsn</code>	String. Name of database where <code>*_layers</code> reside.
<code>dbTabs</code>	List of database tables the user would like returned. See <code>help(dbTables)</code> for a list of options.
<code>eval</code>	String. Type of evaluation time frame for data extraction ('FIA', 'custom'). See <code>eval_opts</code> for more further options.

eval_opts	List of evaluation options for 'FIA' or 'custom' evaluations to determine the set of data returned. See help(eval_options) for a list of options.
puniqueid	String. Name of unique identifier of plt.
invtype	String. Type of FIA inventory to extract ('PERIODIC', 'ANNUAL'). Only one inventory type (PERIODIC/ANNUAL) at a time.
intensity1	Logical. If TRUE, includes only XY coordinates where INTENSITY = 1 (FIA base grid).
istree	Logical. If TRUE, tree data are extracted from TREE table in database.
isseed	Logical. If TRUE, seedling data are extracted from SEEDLING table in database.
isveg	Logical. If TRUE, understory vegetation tables are extracted from FIA database (P2VEG_SUBPLOT_SPP, P2VEG_SUBP_STRUCTURE, INVASIVE_SUBPLOT_SPP).
issubp	Logical. If TRUE, subplot tables are extracted from FIA database (SUBPLOT, SUBP_COND).
ischng	Logical. If TRUE, sccm (SUBP_COND_CHNG_MTRX) table is returned that includes current and previous conditions.
isdwm	Logical. If TRUE, summarized condition-level down woody debris data are extracted from FIA database (COND_DWM_CALC).
biojenk	Logical. If TRUE, Jenkins biomass is calculated.
greenwt	Logical. If TRUE, green weight biomass is calculated.
plotgeom	Logical. If TRUE, variables from the PLOTGEOM table are appended to the plot table.
othertables	String Vector. Name of other table(s) in FIADB to include in output. The table must have PLT_CN as unique identifier of a plot.
ACI	Logical. If TRUE, the data from All Condition Inventories (ACI) are included in dataset (NF_SAMPLING_STATUS_CD = 1). See below for more details.
clipxy	Logical. If TRUE, clips xy data to bnd.
pjoinid	String. Variable in plt to join to XY data. Not necessary to be unique. If using most current XY coordinates, use identifier for a plot (e.g., PLOT_ID).
showsteps	Logical. If TRUE, display data in device window.
returndata	Logical. If TRUE, returns data objects.
savedata	Logical. If TRUE, saves data to outfolder.
savePOP	Logical. If TRUE, save and return the POP_PLOT_STRATUM_ASSGN table.
savebnd	Logical. If TRUE, saves bnd. If out_fmt='sqlite', saves to a SpatialLite database.
returnxy	Logical. If TRUE, save xy coordinates to outfolder.
exportsp	Logical. If returnxy=TRUE, if TRUE, saves xy data as spatial data. If FALSE, saves xy data as table.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE.
spXYdat	R list object. Output from spGetXY().
gui	Logical. If TRUE, uses gui interface.
...	parameters passed to DBgetPlot().

**Details****datsource**

Plots are extracted from 3 different data sources:

- 1) CSV - data have previously been extracted from the FIA database and stored as CSV files.
- 2) datamart - data are extracted from FIA's publically-available datamart.
- 3) sqlite - data have previously been extracted from the FIA database and stored within a SQLite database.

**Selection parameters**

FIA plots are selected based on the following parameters:

evalid - the FIA evaluation identifier

evalCur - the most current FIA evaluation in database

evalEndyr - the FIA evaluation ending in evalEndyr

evalType - the FIA evaluation type ('ALL', 'AREAVOL', 'GRM', 'P2VEG', 'DWM', 'INV', 'REGEN', 'CRWN')

measCur - the most current measurement of each plot in database

measEndyr - the most current measurement of each plot in database in or prior to measEndyr

Endyr.filter - a filter for bnd that specifies the boundary where measEndyr should be applied

**Value**

xypltx	sf object. Input xy data clipped to boundary.
bndx	sf object. Input bnd.
tabs	list object. List of input layers clipped to boundary (pltx,condx,etc.).
xy.uniqueid	String. Name of unique identifier of xy.
puniqueid	String. Name of unique identifier of plot in plt.
pjoinid	String. Name of unique identifier of plot in plt.

If savedata=TRUE, outdat data frame is saved to outfolder.

**Note**

If savebnd=TRUE:

If out\_fmt=c('csv','shp'), the writeOGR (rgdal) function is called. The ArcGIS driver truncates variable names to 10 characters or less. Variable names are changed before export using an internal function (trunc10shp). If Spatial object has more than 1 record, it will be returned but not exported.

If datsource="datmart", data are imported from FIA DataMart. The plot coordinates have been altered for privacy (See <https://www.fia.fs.fed.us/tools-data/spatial/Policy/index.php> for details). The zip files are extracted on-the-fly from the online website. Web server connections will affect download speeds.

spGetSAdoms

*Spatial wrapper - Generate a set of model domain units for Small Area Estimation (SAE) strategies.*

---

**Description**

Spatial process to generate a set of model domains (i.e., helper polygons) for Small Area Estimation (SAE) strategies. If helper\_autoselect=TRUE, an automated process is used to select helper polygons within a large area overlapping the small area. The helper polygons are unioned with the small area polygons, resulting in a set of model domains that can be used for SAE.

**Usage**

```
spGetSAdoms(
  smallbnd,
  smallbnd_dsn = NULL,
```

```

smallbnd.unique = NULL,
smallbnd.domain = NULL,
smallbnd.filter = NULL,
smallbnd.stfilter = NULL,
helperbnd = NULL,
helperbnd_dsn = NULL,
helperbnd.unique = NULL,
helperbnd.filter = NULL,
largebnd = NULL,
largebnd_dsn = NULL,
largebnd.unique = NULL,
largebnd.filter = NULL,
maxbnd = NULL,
maxbnd_dsn = NULL,
maxbnd.unique = NULL,
maxbnd.filter = NULL,
helper_autoselect = TRUE,
nbrdom.min = NULL,
maxbnd.threshold = 10,
largebnd.threshold = 5,
multiSAdoms = FALSE,
showsteps = TRUE,
savedata = FALSE,
savesteps = FALSE,
saveobj = FALSE,
objnm = "SAdomdat",
maxbnd.addtext = TRUE,
largebnd.addtext = FALSE,
savedata_opts = NULL,
addstate = FALSE,
dissolve = FALSE,
byeach = FALSE
)

```

### Arguments

- smallbnd** sf R object or String. Small area of interest boundary. Can be a spatial polygon object, full pathname to a shapefile, or name of a layer within a database.
- smallbnd\_dsn** String. Data source name (dsn; e.g., sqlite or shapefile pathname) of smallbnd. The dsn varies by driver. See gdal OGR vector formats ([https://www.gdal.org/ogr\\_formats.html](https://www.gdal.org/ogr_formats.html)). Optional if smallbnd is an R object.
- smallbnd.unique** String. The attribute in smallbnd that defines unique domain identifier in smallbnd that defines the unique small area(s). If NULL, an attribute is appended to smallbnd attribute table and used as smallbnd.unique, defining one polygon (SMALLAREA="SMALLAREA").
- smallbnd.domain** String. A different attribute to use as for grouped modeling domains (optional).

	If NULL, smallbnd.domain=smallbnd.unique.
smallbnd.filter	String. A filter for smallbnd. Must be R syntax.
smallbnd.stfilter	String. A spatial filter for smallbnd to include only smallbnd polygons that intersect (or overlap $\geq 30$ boundary. The filter is based on the stunitco internal R object, with attributes: STATECD, STATENM, UNITCD, UNITNM, COUNTYCD, COUNTYNM. The filter should include one of these attributes and must be R syntax.
helperbnd	sf R object or String. Name of polygon spatial layer delineating helper polygons for small area models. Can be a spatial polygon object, full pathname to a shapefile, or name of a layer within a database.
helperbnd_dsn	String. Data source name (dsn; e.g., sqlite or shapefile pathname) of helperbnd. The dsn varies by driver. See gdal OGR vector formats ( <a href="https://www.gdal.org/ogr_formats.html">https://www.gdal.org/ogr_formats.html</a> ). Optional if helperbnd is an R object.
helperbnd.unique	String. The attribute in helper polygon layer that defines unique helper polygons.
helperbnd.filter	String. A filter for helperbnd. Must be R syntax.
largebnd	sf R object or String. Name of large area polygon spatial layer, defining the model data extent for building small are models. Can be a spatial polygon object, full pathname to a shapefile, or name of a layer within a database.
largebnd_dsn	String. Data source name (dsn; e.g., sqlite or shapefile pathname) of largebnd. The dsn varies by driver. See gdal OGR vector formats ( <a href="https://www.gdal.org/ogr_formats.html">https://www.gdal.org/ogr_formats.html</a> ). Optional if largebnd is an R object.
largebnd.unique	String. The attribute in largebnd polygon layer that defines unique large area polygon(s).
largebnd.filter	String. A filter for largebnd. Must be R syntax.
maxbnd	sf R object or String. Name of polygon spatial layer, defining the maximum model data restraint for adding more helper polygons for building small are models. Can be a spatial polygon object, full pathname to a shapefile, or name of a layer within a database.
maxbnd_dsn	String. Data source name (dsn; e.g., sqlite or shapefile pathname) of maxbnd. The dsn varies by driver. See gdal OGR vector formats ( <a href="https://www.gdal.org/ogr_formats.html">https://www.gdal.org/ogr_formats.html</a> ). Optional if maxbnd is an R object.
maxbnd.unique	String. The attribute in maxbnd polygon layer that defines unique max restraint area(s).
maxbnd.filter	String. A filter for maxbnd. Must be R syntax.
helper_autoselect	Logical. If TRUE, the helper boundaries are automatically selected based on intersection with maxbnd and/or largebnd and number of helperbnds defined by nbrdom.min.

nbrdom.min	Integer. Set number for minimum domains for modeling. If NULL, all domains within largebnd are selected.
maxbnd.threshold	Integer. Percent for including additional maxbnds for selecting helperbnds. If multiSAdoms=FALSE, the maxbnd with greatest percentage over the maxbnd.threshold is selected.
largebnd.threshold	Integer. Percent for including additional largebnds for selecting helperbnds.
multiSAdoms	Logical. If TRUE, and the percent intersect of smallbnd with maxbnd is greater than maxbnd.threshold, more than 1 SAdoms will be output in list.
showsteps	Logical. If TRUE, intermediate steps of selection process are displayed.
savedata	Logical. If TRUE, save SAdoms spatial layer to outfolder.
savesteps	Logical. If TRUE, save steps spatial intermediate layers and JPG images. All spatial layers are output as *.shp format in a separate folder (SAdoms_steps).
saveobj	Logical. If TRUE, save SAdomdat object to outfolder.
objnm	String. Name of *.rds object.
maxbnd.addtext	Logical. If TRUE, adds text to intermediate step plots for maxbnd displays.
largebnd.addtext	Logical. If TRUE, adds text to intermediate step plots for largebnd displays.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE.
addstate	Logical. If TRUE, appends state attribute to SAdoms.
dissolve	Logical. If TRUE, aggregates polygons to smallbnd.domain or smallbnd.unique.
byeach	Logical. If TRUE, creates an SAdom for each smallbnd polygon.

## Details

### optional boundaries

The helperbnd, largebnd, and maxbnd are optional. If helperbnd=NULL, the smallbnd polygons are used for model domain units. If largebnd=NULL, the maxbnd is used to define the large area. If maxbnd=NULL, the largebnd is used to restrain the model extent. If both, largebnd=NULL and maxbnd=NULL, the extent of the smallbnd or helperbnd is used for defining and restraining the model extent.

### nbrdom.min

The number of helper polygons selected are defined by nbrdom.min parameter. If nbrdom.min=NULL, all helper polygons within the large area extent are selected.

### multiSAdoms

Use multiSAdoms parameter when small area of interest has multiple polygon features and the small area polygons overlap (within maxbnd.threshold) more than one maxbnd polygon. If multiSAdoms=TRUE, more than one set of model domain units are generated; one for each maxbnd where overlap is within maxbnd.threshold. If multiSAdoms=FALSE, only one set of model domain units are generated, using the maxbnd with the greatest overlap.

### AOI attribute

A variable named 'AOI' is appended to the SAdoms attribute table to distinguish between the small area of interest polygons and the helper domain units.

**Value**

SAdoms1st	List object. Set(s) of model domain units. If multiSAdoms=TRUE, the list may have more than one set of model domain units.
smallbnd1st	List object. smallbnd(s). If multiSAdoms=TRUE, the list may have more than one set of smallbnd.

If exportsp=TRUE, the SAdoms spatial object(s) is exported to outfolder, with format specified by out\_fmt.

**Note**

If exportsp=TRUE and out\_fmt="shp":

The writeOGR (rgdal) function is called. The ArcGIS driver truncates variable names to 10 characters or less. Variable names are changed before export using an internal function (trunc10shp). If Spatial object has more than 1 record, it will be returned but not exported.

The spTransform (rgdal) method is used for on-the-fly map projection conversion and datum transformation using PROJ.4 arguments. Datum transformation only occurs if the +datum tag is present in the both the from and to PROJ.4 strings. The +towgs84 tag is used when no datum transformation is needed. PROJ.4 transformations assume NAD83 and WGS84 are identical unless other transformation parameters are specified. Be aware, providing inaccurate or incomplete CRS information may lead to erroneous data shifts when reprojecting. See spTransform help documentation for more details.

**Author(s)**

Tracey S. Frescino

---

spGetStates

*Spatial wrapper - Extracts states that intersect a boundary.*

---

**Description**

Wrapper to get state names that intersect a given boundary.

**Usage**

```
spGetStates(
  bnd_layer,
  bnd_dsn = NULL,
  bnd.filter = NULL,
  stbnd.att = "COUNTYFIPS",
  RS = NULL,
  states = NULL,
  overlap = 1,
  showsteps = FALSE,
  savebnd = FALSE,
  savedata_opts = NULL
)
```

**Arguments**

bnd_layer	sf R object, Area of Interest (AOI) boundary. Can be a spatial sf object, full pathname to a shapefile, or name of a layer within a database.
bnd_dsn	String. Data source name (dsn; e.g., SQLite database or shapefile pathname) of bnd. The dsn varies by driver. See gdal OGR vector formats ( <a href="https://www.gdal.org/ogr_formats.html">https://www.gdal.org/ogr_formats.html</a> ).
bnd.filter	String. Filter to subset bnd spatial layer.
stbnd.att	String. Attribute in stunitco to output ('STATECD', 'STATENM', 'COUNTY-FIPS').
RS	String. Name of FIA research station to restrict states to ('RMRS', 'SRS', 'NCRS', 'NERS', 'PNWRS'). If NULL, all research stations are included.
states	String. States to subset boundary to.
overlap	Number. Percent overlap to include.
showsteps	Logical. If yes, display intersecting boundaries.
savebnd	Logical. If yes, save boundary to outfolder.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savebnd = TRUE.

**Value**

A list containing states and state names that the boundary crosses, and boundary and attribute information for the intersecting boundary.

**Author(s)**

Tracey S. Frescino

**Examples**

```
# Get polygon vector layer from FIESTA external data
WYbhdistfn <- system.file("extdata",
                          "sp_data/WYbighorn_districtbnd.shp",
                          package = "FIESTA")

# Get intersecting statenames
spGetStates(WYbhdistfn)$statenames

# Get intersecting COUNTYFIP codes
spGetStates(WYbhdistfn,
             stbnd.att = "COUNTYFIPS")$states
```

---

spGetStrata	<i>Spatial wrapper - Extracts point attribute values and pixel counts for strata and estimation unit spatial layers.</i>
-------------	--

---

## Description

Wrapper to extract attribute and area from a polygon or raster estimation unit layer and a polygon or raster layer with strata pixel categories.

## Usage

```
spGetStrata(
  xyplt,
  xyplt_dsn = NULL,
  unit_layer,
  unit_dsn = NULL,
  uniqueid = "PLT_CN",
  unitvar = NULL,
  unit.filter = NULL,
  strattype = "RASTER",
  strat_layer = NULL,
  strat_dsn = NULL,
  strvar = NULL,
  strat_lut = NULL,
  areaunits = "acres",
  rast.NODATA = NULL,
  keepNA = FALSE,
  showext = FALSE,
  returnxy = FALSE,
  savedata = FALSE,
  exportsp = FALSE,
  exportNA = FALSE,
  spMakeSpatial_opts = NULL,
  savedata_opts = NULL,
  vars2keep = NULL,
  gui = FALSE
)
```

## Arguments

xyplt	Data frame, sf object, full pathname to *.csv or *.shp, or layer name in a geo-database. Includes XY coordinates and unique identifier. If non-spatial, include options in spMakeSpatial_opts parameter.
xyplt_dsn	String. Name of database where xyplt is. The dsn varies by driver. See gdal OGR vector formats ( <a href="https://www.gdal.org/ogr_formats.html">https://www.gdal.org/ogr_formats.html</a> ).

unit_layer	sf R object or String. Name of estimation unit spatial layer. Can be a spatial polygon object, full pathname to a shapefile, name of a polygon layer within a database, or a full pathname to raster file.
unit_dsn	String. Data source name (dsn; e.g., sqlite or shapefile pathname) of unit_layer. The dsn varies by driver. See gdal OGR vector formats ( <a href="https://www.gdal.org/ogr_formats.html">https://www.gdal.org/ogr_formats.html</a> ). Optional if unit_layer is sf object.
uniqueid	String.* Unique identifier of xyplt records. Note: raster unit layers are converted to polygon.
unitvar	String. If unittype="POLY", name of attribute in unit_layer defining estimation units. If NULL, the unit_layer represents one estimation unit.
unit.filter	String. Filter to subset unit_layer spatial layer.
strattype	String. Spatial layer type of strat_layer ("POLY", "RASTER"). Note: polygon strata layers are converted to raster.
strat_layer	sf R object or full pathname of spatial stratification layer. Can be a spatial polygon object, full pathname to a shapefile, name of a polygon layer within a database, or a full pathname to raster file.
strat_dsn	String. Data source name (dsn; e.g., sqlite or shapefile pathname) of strat_layer. The dsn varies by driver. See gdal OGR vector formats ( <a href="https://www.gdal.org/ogr_formats.html">https://www.gdal.org/ogr_formats.html</a> ). Optional if unit_layer is sf object.
strvar	String. If strattype="POLY", name of strata attribute in strat_layer.
strat_lut	Data frame. A look-up table of codes to aggregate. The format of table includes 2 columns, one column same name as strvar. If strattype="RASTER", strvar="value".
areaunits	String. Output area units ("acres", "hectares", "sqmeters").
rast.NODATA	Numeric. NODATA value if stratlayer is raster (See notes). This values will be converted to NA and removed from output. if keepNA=TRUE, NA values will not be in included in stratalut but will remain in pltassgn table.
keepNA	Logical. If TRUE, returns data frame of NA values.
showext	Logical. If TRUE, layer extents are displayed in plot window.
returnxy	Logical. If TRUE, returns xy data as sf object (spxyplt).
savedata	Logical. If TRUE, the input data with extracted values are saved to outfolder.
exportsp	Logical. If savedata=TRUE and returnxy=TRUE, If TRUE, the extracted strata point data are exported to outfolder.
exportNA	Logical. If TRUE and keepNA=TRUE, NA values are exported to outfolder as a point shapefile.
spMakeSpatial_opts	List. See help(spMakeSpatial_options()) for a list of options. Use to convert X/Y values to simple feature (sf) coordinates.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE.
vars2keep	String vector. Attributes in SAdoms, other than domvar to include in dunitlut output and extract to pltassgn points.
gui	Logical. If gui, user is prompted for parameters.

**Details**

\*If variable = NULL, then it will prompt user for input.

If spatial layers have different projections, the polygon spatial layer is transformed to the projection of raster (See note about on-the-fly projection conversion). If both layers are long/lat coordinate system, they are transformed to default coordinate system (Conus Albers, NAD83).

**Value**

pltassgn	Data frame. Input xyplt data with extracted estimation unit and strata values appended.
unitarea	Data frame. Area by estimation unit.
unitvar	Data frame. Variable name for estimation unit in unitarea.
acrevar	Data frame. Variable name for area in unitarea.
stratalut	Data frame. Strata proportions (weights) by estimation unit and strata.
strvar	Data frame. Variable name for strata values in stratalut.
NA1st	sf List. If keepNA=TRUE, and NA values exist after data extraction, the spatial NA points are returned.
pltassgnid	String. Unique identifier of plot.
spxy	Simple feature. If returnxy=TRUE, Spatial coordinates.
xy.uniqueid	String. If returnxy=TRUE, unique identifier of spxy.

If savedata=TRUE, pltassgn and unitarea are saved to outfolder.

If exportsp=TRUE, the spatial sf points object is exported to outfolder.

. If exportNA=TRUE and NA values exist after data extraction, the spatial NA points are exported to outfolder.

**Note****rast.NODATA**

NODATA values are raster pixel values that have no data of interest, including pixels within the extent of the layer, but outside the area of interest. Sometimes these pixels have been defined previously. The defined NODATA pixels are imported to R as NULL values. When not previously defined, the pixels outside the area of interest will be the minimum or maximum value depending on the data type (e.g., 16-bit signed: min=-32,768; max=32,768) or byte size (1 byte: min=0; max=255). These NODATA values will be added to the zonal statistic calculations if not specified in rast.NODATA.

If exportsp=TRUE:

If out\_fmt="shp", the writeOGR (rgdal) function is called. The ArcGIS driver truncates variable names to 10 characters or less. Variable names are changed before export using an internal function (trunc10shp). If Spatial object has more than 1 record, it will be returned but not exported.

**On-the-fly projection conversion**

The spTransform (rgdal) method is used for on-the-fly map projection conversion and datum transformation using PROJ.4 arguments. Datum transformation only occurs if the +datum tag is present in the both the from and to PROJ.4 strings. The +towgs84 tag is used when no datum transformation is needed. PROJ.4 transformations assume NAD83 and WGS84 are identical unless other transformation parameters are specified. Be aware, providing inaccurate or incomplete CRS information

may lead to erroneous data shifts when reprojecting. See spTransform help documentation for more details.

#### unitarea

Area by estimation unit is calculated and returned as object named unitarea. Area is based on the projection of unit\_layer. If no unit\_layer input, than area is calculated from pixel counts.

#### polygon to raster

If strattype="POLY", a raster template is created based on the masked extent of strat\_layer, with strat\_layer projected coordinate system and 30 meter pixel size.

### Examples

```
# Create a `SpatialPoints` object from `WYplt`
WYspplt <- spMakeSpatialPoints(xyplt = WYplt,
                              xy.uniqueid = "CN",
                              xvar = "LON_PUBLIC",
                              yvar = "LAT_PUBLIC",
                              xy.crs = 4269)

# Set up stratification from object in `FIESTA`
fornffn <- system.file("extdata",
                      "sp_data/WYbighorn_forest_nonforest_250m.tif",
                      package = "FIESTA")

# Set up data from FIESTA
WYbhfn <- system.file("extdata",
                      "sp_data/WYbighorn_adminbnd.shp",
                      package = "FIESTA")

# Run `spGetStrata`
spGetStrata(WYspplt,
            uniqueid = "CN",
            unit_layer = WYbhfn,
            strattype = "RASTER",
            strat_layer = fornffn)
```

---

spGetXY

*Spatial wrapper - Extracts XY coordinates within a given boundary.*

---

### Description

Wrapper to get FIA plots within the boundary population (area of interest) - Intersect with state boundary - Get FIA plots for intersected states, including tree, and spatial - Clip spatial coordinates and other tables to boundary (spClipPoint)

**Usage**

```

spGetXY(
  bnd,
  bnd_dsn = NULL,
  bnd.filter = NULL,
  states = NULL,
  RS = NULL,
  xy_datsource = "datamart",
  xy_dsn = NULL,
  xy = "PLOT",
  xy_opts = xy_options(),
  datsource = NULL,
  data_dsn = NULL,
  dbTabs = dbTables(),
  eval = "FIA",
  eval_opts = NULL,
  pjoinid = "CN",
  invtype = "ANNUAL",
  intensity1 = FALSE,
  pvars2keep = NULL,
  clipxy = TRUE,
  showsteps = FALSE,
  returnxy = TRUE,
  savedata = FALSE,
  exportsp = FALSE,
  savedata_opts = NULL
)

```

**Arguments**

<code>bnd</code>	sf R object, Area of Interest (AOI) boundary. Can be a spatial sf object, full pathname to a shapefile, or name of a layer within a database.
<code>bnd_dsn</code>	String. Data source name (dsn; e.g., SQLite database or shapefile pathname) of <code>bnd</code> . The dsn varies by driver. See gdal OGR vector formats ( <a href="https://www.gdal.org/ogr_formats.html">https://www.gdal.org/ogr_formats.html</a> ). Optional if <code>bnd</code> is an R object.
<code>bnd.filter</code>	String. Filter to subset <code>bnd</code> spatial layer.
<code>states</code>	String. The name of state(s) for tables (e.g., "Vermont", "Utah").
<code>RS</code>	String. Name of FIA research station to restrict states to ('RMRS', 'SRS', 'NCRS', 'NERS', 'PNWRS'). If NULL, all research stations are included.
<code>xy_datsource</code>	Source of XY data ('datamart', 'sqlite', 'obj', 'csv').
<code>xy_dsn</code>	If <code>datsource='sqlite'</code> , the file name (data source name) of the sqlite database (*.db) where XY data reside.
<code>xy</code>	sf R object or String. If <code>xy_dsn = 'datamart'</code> , name of xy table in FIA DataMart. If <code>xy_dsn = 'sqlite'</code> , name of xy layer in database. If <code>datsource = 'csv'</code> , full pathname of xy CSV file(s). If <code>datsource = 'obj'</code> , name of xy R object. If <code>datsource = 'shp'</code> , full pathname of shapefile.

xy_opts	List of xy data options for xy (e.g., xy_opts = list(xvar='LON', yvar='LAT')). See xy_options() for more options and defaults.
datasource	String. Source of FIA data for defining FIA evaluations or appending variables ('datamart', 'sqlite', 'obj', 'csv'). If datasource = NULL, datasource = xy_datasource. If datasource = 'datamart', data are downloaded extracted from FIA DataMart ( <a href="http://apps.fs.usda.gov/fia/datamart/datamart.html">http://apps.fs.usda.gov/fia/datamart/datamart.html</a> ). If datasource='sqlite', specify database name(s) in data_dsn and table name(s) in dbTabs() argument. If datasource = ('obj','csv'), specify *.csv file name in dbTabs argument.
data_dsn	String. Name of database with plot_layer and/or ppsa_layer.
dbTabs	String or R Object. If data_dsn = 'datamart', name of table(s) in FIA DataMart. If data_dsn = 'sqlite', name of layer(s) in database. If datasource = 'csv', name of CSV file(s). If datasource = 'obj', name of R object.
eval	String. Type of evaluation time frame for data extraction ('FIA', 'custom'). See eval_opts for more further options.
eval_opts	List of evaluation options for 'FIA' or 'custom' evaluations to determine the set of data returned. See help(eval_options) for a list of options.
pjoinid	String. Variable in plt to join to XY data. Not necessary to be unique. If using most current XY coordinates, use identifier for a plot (e.g., PLOT_ID).
invtype	String. Type of FIA inventory to extract ('PERIODIC', 'ANNUAL'). Only one inventory type (PERIODIC/ANNUAL) at a time.
intensity1	Logical. If TRUE, includes only XY coordinates where INTENSITY = 1 (FIA base grid).
pvars2keep	String vector. One or more variables in pltTab to append to output.
clipxy	Logical. If TRUE, clips xy data to bnd.
showsteps	Logical. If TRUE, display data in device window.
returnxy	Logical. If TRUE, returns XY coordinates.
savedata	Logical. If TRUE, saves data to outfolder. Note: includes XY data if returnxy = TRUE.
exportsp	Logical. If savedata = TRUE and returnxy = TRUE, if TRUE, exports XY data as spatial data.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE.

## Details

### datasource

Plots are extracted from 3 different data sources:

- 1) CSV - data have previously been extracted from the FIA database and stored as CSV files.
- 2) datamart - data are extracted from FIA's publically-available datamart.
- 3) sqlite - data have previously been extracted from the FIA database and stored within a SQLite database.

### Selection parameters

FIA plots are selected based on the following parameters:

evalid - the FIA evaluation identifier  
 evalCur - the most current FIA evaluation in database  
 evalEndyr - the FIA evaluation ending in evalEndyr  
 evalType - the FIA evaluation type ('ALL', 'AREAVOL', 'GRM', 'P2VEG', 'DWM', 'INV', 'REGEN', 'CRWN')  
 measCur - the most current measurement of each plot in database  
 measEndyr - the most current measurement of each plot in database in or prior to measEndyr  
 Endyr.filter - a filter for bnd that specifies the boundary where measEndyr should be applied

### Value

spxy	sf. If returnxy=TRUE, spatial xy point data.
pltids	data frame. A table of pltids that are within bnd.
spxy	sf data frame. If returnxy, a simple feature with pltids within bnd.
bndx	sf object. Input bnd.
xy.uniqueid	String. Unique identifier of plots in xy.
states	String. Vector of states that intersect bnd.
countyfips	String. Vector of countyfips values that intersect bnd.
stbnd.att	String. Name of state attribute used to select plots.

If savedata=TRUE and returnxy=TRUE, the plt data frame, including XY coordinates is saved to outfolder (xyplt).

If savedata=TRUE and returnxy=FALSE, the plt data frame, without XY coordinates is saved to outfolder (pltids).

If savedata=TRUE and returnxy=TRUE and exportsp=TRUE, the spxy sf object is exported as shapefile to outfolder.

### Note

If savebnd=TRUE:

If out\_fmt=c('csv','shp'), the writeOGR (rgdal) function is called. The ArcGIS driver truncates variable names to 10 characters or less. Variable names are changed before export using an internal function (trunc10shp). If Spatial object has more than 1 record, it will be returned but not exported.

If datasource="datmart", (default), data are imported from FIA DataMart. The plot coordinates have been altered for privacy (See <https://www.fia.fs.fed.us/tools-data/spatial/Policy/index.php> for details). The zip files are extracted on-the-fly from the online website. Web server connections will affect download speeds.

```
## Not run:
# Set up data from FIESTA
```

```

WYbhfn <- system.file("extdata",
                     "sp_data/WYbighorn_adminbnd.shp",
                     package = "FIESTA")

# Use spGetXY
WYbhxy <- spGetXY(bnd = WYbhfn,
                  xy_datsource = "datamart",
                  eval = "custom",
                  eval_opts = list(Cur = TRUE),
                  returnxy = TRUE)

## End(Not run)

```

---

spImportSpatial

*Spatial - Imports a spatial vector layer to an S4 Spatial object.*

---

### Description

Imports a spatial vector layer to an S4 Spatial object.

### Usage

```

spImportSpatial(
  layer = NULL,
  dsn = NULL,
  sql = NULL,
  polyfix = FALSE,
  gui = FALSE
)

```

### Arguments

layer	Data frame object or String. Name of spatial layer. Can be layer with dsn, full pathname, including extension, or file name (with extension) in xy_dsn folder.
dsn	String. Name of database where layer is. The dsn varies by driver. See gdal OGR vector formats ( <a href="https://www.gdal.org/ogr_formats.html">https://www.gdal.org/ogr_formats.html</a> ).
sql	String. A sql syntax query to subset spatial layer.
polyfix	Logical. If polyfix=TRUE, uses buffer with 0 width to clean up polygons.
gui	Logical. If TRUE, search for layer within dsn.

### Value

A spatial object

### Note

Wrapper for sf package... st\_read function.

**Author(s)**

Tracey S. Frescino

**Examples**

```
# Import data from `FIESTA`, save as object in environment
WYbh <- spImportSpatial(system.file("extdata",
                                   "sp_data/WYbighorn_adminbnd.shp",
                                   package = "FIESTA"))
```

---

spMakeSpatialPoints     *Spatial - Generates an S4 SpatialPoints object from X/Y coordinates.*

---

**Description**

Generates an S4 SpatialPoints object with defined projection from a data table or matrix including X and Y coordinates, with option to export as an ArcGIS shapefile (\*.shp).

**Usage**

```
spMakeSpatialPoints(
  xyplt,
  xyplt_dsn = NULL,
  xy.uniqueid = NULL,
  xvar = NULL,
  yvar = NULL,
  xy.crs = 4269,
  prj = NULL,
  datum = NULL,
  zone = NULL,
  zoneS = FALSE,
  aea.param = "USGS",
  addxy = FALSE,
  exportsp = FALSE,
  savedata_opts = NULL
)
```

**Arguments**

xyplt	Data frame object or String. Name of layer with xy coordinates and unique identifier. Can be layer with xy_dsn, full pathname, including extension, or file name (with extension) in xy_dsn folder.
xyplt_dsn	String. Name of database or folder where xyplt is. The dsn varies by driver. See gdal OGR vector formats ( <a href="https://www.gdal.org/ogr_formats.html">https://www.gdal.org/ogr_formats.html</a> ).
xy.uniqueid	String. Unique identifier of xyplt rows.
xvar	String. Name of variable in xyplt defining x coordinate.

yvar	String. Name of variable in xyplt defining y coordinate.
xy.crs	PROJ.4 String or CRS object or Integer EPSG code defining Coordinate Reference System. (e.g., EPSG:4269-Geodetic coordinate system for North America, NAD83).
prj	String. Projection, or coordinate system of the X/Y coordinates ("longlat", "utm", "aea"). If other, include PROJ.4 string in prj4str.
datum	String. Datum of projection ("WGS84", "NAD83", "NAD27").
zone	Integer. If prj="utm", the UTM zone.
zones	Logical. If prj="utm", if the UTM zone is in the Southern hemisphere.
aea.param	String. If prj="aea", the associated lat/lon parameters (USGS: " +lat_1=29.5 +lat_2=45.5 +lat_0=23 +lon_0=-96 +x_0=0 +y_0=0"). If other, include PROJ.4 string in prj4str.
addxy	Logical. If TRUE, adds x and y variables to spatial sf object.
exportsp	Logical. If TRUE, exports spatial object.
savadata_opts	List. See help(savadata_options()) for a list of options. Only used when exportsp = TRUE.

**Value**

spl t                    sf object with spatial points and defined CRS.

If exportsp = TRUE, the sf object is written to specified output.

**Note**

If exportsp=TRUE and a shp output format is specified:

The ESRI shapefile driver truncates variable names to 10 characters or less. Variable names are changed before export using an internal function (trunc10shp). Name changes are output to the outfolder, 'outshpnm'\_newnames.csv. The returned Spatial object will have original names, before truncating.

If Spatial object has more than 1 record, it cannot be exported.

Common Datums and associated spheroid (ellipsoid):

NAD27 - North American Datum of 1927 - Clarke 1866 spheroid

NAD83 - North American Datum of 1983 - GRS 1980 spheroid

WGS84 - World Geodetic System of 1984 - WGS 1984 spheroid

**Author(s)**

Tracey S. Frescino

**Examples**

```
# Generate an `sf` points object with `spMakeSpatialPoints` for Wyoming plot
# data, stored in `FIESTA`
spMakeSpatialPoints(xyplt = WYplt,
                    xy.uniqueid = "CN",
```

```
xvar = "LON_PUBLIC",
yvar = "LAT_PUBLIC",
prj = "longlat",
datum = "NAD83")
```

---

spPoly2Rast

*Spatial - Converts SpatialPolygons layer to raster.*

---

## Description

Converts SpatialPolygons layer to raster.

## Usage

```
spPoly2Rast(
  polyv,
  polyv_dsn = NULL,
  polyv.att,
  polyv.lut = NULL,
  rastfn.template = NULL,
  NODATA = NULL,
  outfolder = NULL,
  outfn = "polyrast",
  outext = "img",
  outfn.pre = NULL,
  outfn.date = TRUE,
  overwrite = FALSE
)
```

## Arguments

polyv	sf R object or String. Polygon data to convert to raster. Can be a spatial polygon object, full pathname to a shapefile, or name of a layer within a database.
polyv_dsn	String. Data source name (dsn; e.g., sqlite or shapefile pathname) of layer to convert. The dsn varies by driver. See gdal OGR vector formats ( <a href="https://www.gdal.org/ogr_formats.html">https://www.gdal.org/ogr_formats.html</a> ). Optional if polyv is sf object.
polyv.att	String. Name of attribute in polyv to rasterize.
polyv.lut	Data frame. Look up table of codes, if polyv.att is character or want to group codes.
rastfn.template	String. Full path name of raster to use as template for new raster.
NODATA	Number. The NODATA value for background values. If NODATA is NULL, and a NODATA value is defined on the rastfn.template raster, the default is the defined NODATA value, else it is defined based on its datatype (see DEFAULT_NODATA for default data values).

outfolder	String. If exportshp=TRUE, name of output folder. If NULL, the working directory is used.
outfn	String. Name of output raster. If NULL, default is 'polyrast'.
outext	String. Name of raster extension (fmt).
outfn.pre	String. Add a prefix to output name (e.g., "01").
outfn.date	Logical. If TRUE, add date to end of outfile (e.g., outfn_'date'.csv).
overwrite	Logical. If TRUE and exportshp=TRUE, overwrite files in outfolder.

**Value**

A list containing raster and raster information derived from the original polygon.

**Note****On-the-fly projection conversion**

The `spTransform` (`rgdal`) method is used for on-the-fly map projection conversion and datum transformation using PROJ.4 arguments. Datum transformation only occurs if the `+datum` tag is present in the both the from and to PROJ.4 strings. The `+towgs84` tag is used when no datum transformation is needed. PROJ.4 transformations assume NAD83 and WGS84 are identical unless other transformation parameters are specified. Be aware, providing inaccurate or incomplete CRS information may lead to erroneous data shifts when reprojecting. See `spTransform` help documentation for more details.

If `exportshp=TRUE`:

The `writeOGR` (`rgdal`) function is called. The ArcGIS driver truncates variable names to 10 characters or less. Variable names are changed before export using an internal function (`trunc10shp`). If Spatial object has more than 1 record, it will be returned but not exported.

**Author(s)**

Tracey S. Frescino

**Examples**

```
# Get polygon vector layer from FIESTA external data
WYbhdistfn <- system.file("extdata",
                        "sp_data/WYbighorn_districtbnd.shp",
                        package = "FIESTA")

# Turn polygon into raster
# Note: raster values must be numeric, therefore names were changed to
# numeric codes based on lookup table produced from the following code.
new_rast <- spPoly2Rast(polyv = WYbhdistfn,
                      polyv.att = "DISTRICTNA",
                      outfolder = tempdir())

# Plot result with raster package
raster::plot(raster::raster(new_rast$rastfn))
```

---

spReprojectRaster      *Spatial - Reprojects an Esri shapefile (\*.shp) or S4 Spatial object.*

---

### Description

Reprojects an Esri shapefile (\*.shp) or S4 Spatial object to a new geographic or projected coordinate system, with option to save new object.

### Usage

```
spReprojectRaster(
  rastfn,
  bands = NULL,
  crs = NULL,
  rast.ref = NULL,
  crs.new = NULL,
  res.new = NULL,
  bbox.new = NULL,
  dtype.new = NULL,
  NODATA.new = NULL,
  resamp.method = "near",
  crs.default = "EPSG:5070",
  compress = NULL,
  BigTIFF = FALSE,
  outfolder = NULL,
  outfn = NULL,
  outtext = NULL,
  overwrite = FALSE
)
```

### Arguments

rastfn	String or Raster. File name(s) with extensions, or raster object(s). Note: raster objects must be written to file.
bands	Numeric vector. If rast is a multi-layer raster and only 1 or some layers are desired, specify layer number(s) in a vector format. If NULL, all layers are projected.
crs	Coordinate Reference System (CRS). The CRS of rastfn if not defined. EPSG:code, PROJ.4 declaration, or .prj file containing WKT. For example, PROJ.4: "+proj=moll +lon_0=0 +x_0=0 +y_0=0 +ellps=WGS84 +datum=WGS84 +units=m +no_defs". If NULL, and the CRS of rastfn is not defined, uses crs.default.
rast.ref	String or Raster. File name(s) with extensions, or raster object to use as reference raster.
crs.new	Coordinate Reference System. New CRS for rastfn. EPSG:code, PROJ.4 declaration, or .prj file containing WKT. For example, PROJ.4: "+proj=moll +lon_0=0 +x_0=0 +y_0=0 +ellps=WGS84 +datum=WGS84 +units=m +no_defs".

res.new	Integer vector. One or two values defining new resolution of raster (in target georeferenced units) (e.g., 30 or c(30,30)).
bbox.new	<xmin ymin xmax ymax> Georeferenced extent or bounding box of new raster.
dtype.new	String. Force a data type of new raster. If NULL, the data type will be same as rastfn (e.g., Byte, Int16, UInt16).
NODATA.new	Integer. Set nodata values for new raster. New files will be initialized to this value and if possible the nodata value will be recorded in the output file. Use a value of "None" to ensure that nodata is not defined. If NULL, NODATA and rastfn has a set NODATA value, this value will be used for new raster.
resamp.method	Method for resampling ('near', 'bilinear', 'cubic', 'cubicspline', 'landzos', 'average', 'mode', 'min', 'max', 'med', 'q1', 'q3').
crs.default	Coordinate Reference System. A default CRS if crs.new=NULL. The default is: EPSG:5070, Conus Albers, PRJ4='+proj=aea +lat_1=29.5 +lat_2=45.5 +lat_0=23 +lon_0=-96, +x_0=0 +y_0=0', "+ellps=GRS80 +towgs84=0,0,0,-0,-0,0 +units=m +no_defs'.
compress	String. An optional compression type ('LZW', "DEFLATE", "PACKBITS").
BigTIFF	Logical. If TRUE, compress option for big files (> 4GB).
outfolder	String. If exportsp=TRUE, name of output folder. If NULL, the working directory is used.
outfn	String. Name of output raster. If NULL, default is 'polyrast'.
outext	String. Name of raster extension (fmt). If NULL, uses extension from outfn or rastfn.
overwrite	Logical. If TRUE, overwrites raster file.

### Value

rastfn.new String. Full path name to reprojected raster.

### Note

#### Coordinate Reference Systems (CRS)

An ellipse is an estimated model describing the basic shape of the Earth and is the basis for all coordinate systems. There are many ellipsoids designed for local (e.g., NAD27) or global (e.g., WGS84, GRS80) use. The datum defines the reference position of the coordinate axes associated with a specific ellipsoid. Specifying the datum also defines the ellipsoid, whereas specifying the ellipsoid does not provide information of the datum.

WGS84 vs NAD83 WGS84 and NAD83 datums are often used interchangeably, and use very similar ellipsoids (WGS84 and GRS80, respectively), but have different reference points. Slight tectonic shifts through time have caused increased divergence between the two, with NAD83 datum intended to track movements more consistently.

#### Common Datums and associated spheroid (ellipsoid):

NAD27 - North American Datum of 1927 (Clarke 1866 spheroid)

NAD83 - North American Datum of 1983 (GRS 1980 spheroid)

WGS84 - World Geodetic System of 1984 (WGS 1984 spheroid)

From R, use projInfo for list of different projections and datums.

```
> projInfo(type="proj")
> projInfo(type="datum")
```

Common EPSG Geodetic codes in U.S.

EPSG:4326 - Longitude/Latitude (WGS84) - Common for global displays (used by Google Earth)

EPSG:4269 - Longitude/Latitude (NAD83) - Common by U.S. Federal Agencies

The sf::st\_transform (GDAL) method is used for map projection conversion and datum transformation using PROJ.4 arguments. Datum transformation only occurs if the +datum tag is present in the both the from and to PROJ.4 strings. The +towgs84 tag is used when no datum transformation is needed. PROJ.4 transformations assume NAD83 and WGS84 are identical unless other transformation parameters are specified. Be aware, providing inaccurate or incomplete CRS information may lead to erroneous data shifts when reprojecting. See spTransform help documentation for more details.

### Author(s)

Tracey S. Frescino, Chris Toney

### Examples

```
# Get raster layers from FIESTA external data
demfn <- system.file("extdata",
                    "sp_data/WYbighorn_dem_250m.img",
                    package = "FIESTA")

# Plot original projection
raster::plot(raster::raster(demfn))

# Check original projection
sf::st_crs(raster::raster(demfn))$proj4string

# Reproject raster
reprojected <- spReprojectRaster(rastfn = demfn,
                                crs.new = "EPSG:32613",
                                outfolder = tempdir())

# Plot new projection
raster::plot(raster::raster(reprojected))

# Check new projection
sf::st_crs(raster::raster(reprojected))$proj4string
```

---

spReprojectVector      *Spatial - Reprojects an sf spatial object.*

---

### Description

Reprojects an sf spatial object to a new coordinate reference system.

### Usage

```
spReprojectVector(
  layer,
  dsn = NULL,
  crs.new,
  exportsp = FALSE,
  savedata_opts = NULL
)
```

### Arguments

layer	sf class R object or String. The spatial layer must have a defined projection (test using <code>sf::st_crs(layer)</code> ).
dsn	String. Data source name (dsn; i.e., folder or database name) of splayer. The dsn varies by driver. See gdal OGR vector formats ( <a href="https://www.gdal.org/ogr_formats.html">https://www.gdal.org/ogr_formats.html</a> ). Optional if layer is an R object.
crs.new	EPSG Integer or PROJ.4 String. New EPSG Geodetic Parameter Dataset definition or gdal PROJ.4 string identifying the new coordinate system (e.g., "+proj=longlat +datum=NAD83 +no_defs +ellps=GRS80 +towgs84=0,0,0").
exportsp	Logical. If TRUE, the spatial reprojected object is exported to outfolder (see <code>spExportSpatial</code> for details).
savedata_opts	List. See <code>help(savedata_options())</code> for a list of options for saving data. If <code>out_layer = NULL</code> , default = 'layerprj'.

### Value

layerprj      sf object. Reprojected spatial layer.  
 If `exportsp = TRUE`, a spatial layer is written to outfolder (See note).

### Note

#### Coordinate Reference Systems (CRS)

An ellipse is an estimated model describing the basic shape of the Earth and is the basis for all coordinate systems. There are many ellipsoids designed for local (e.g., NAD27) or global (e.g., WGS84, GRS80) use. The datum defines the reference position of the coordinate axes associated with a specific ellipsoid. Specifying the datum also defines the ellipsoid, whereas specifying the ellipsoid does not provide information of the datum.

WGS84 vs NAD83 WGS84 and NAD83 datums are often used interchangeably, and use very similar ellipsoids (WGS84 and GRS80, respectively), but have different reference points. Slight tectonic shifts through time have caused increased divergence between the two, with NAD83 datum intended to track movements more consistently.

Common Datums and associated spheroid (ellipsoid):  
 NAD27 - North American Datum of 1927 (Clarke 1866 spheroid)  
 NAD83 - North American Datum of 1983 (GRS 1980 spheroid)  
 WGS84 - World Geodetic System of 1984 (WGS 1984 spheroid)

From R, use projInfo for list of different projections and datums.

```
> projInfo(type="proj")
> projInfo(type="datum")
```

Common EPSG Geodetic codes in U.S.

EPSG:4326 - Longitude/Latitude (WGS84) - Common for global displays (used by Google Earth)  
 EPSG:4269 - Longitude/Latitude (NAD83) - Common by U.S. Federal Agencies

The sf::st\_transform (GDAL) method is used for map projection conversion and datum transformation using PROJ.4 arguments. Datum transformation only occurs if the +datum tag is present in the both the from and to PROJ.4 strings. The +towgs84 tag is used when no datum transformation is needed. PROJ.4 transformations assume NAD83 and WGS84 are identical unless other transformation parameters are specified. Be aware, providing inaccurate or incomplete CRS information may lead to erroneous data shifts when reprojecting. See spTransform help documentation for more details.

ESRI Shapefile Driver

If exportsp=TRUE:

The writeOGR (rgdal) function is called. If out\_fmt="shp", the ESRI Shapefile driver truncates variable names to 10 characters or less. Variable names are changed before export using an internal function (trunc10shp). If sf object has more than 1 record, it will be returned but not exported.

## Author(s)

Tracey S. Frescino

## Examples

```
# Set up `SpatialPoints` object
WYspplt <- spMakeSpatialPoints(xyplt = WYplt,
                              xy.uniqueid = "CN",
                              xvar = "LON_PUBLIC",
                              yvar = "LAT_PUBLIC",
                              prj = "longlat",
                              datum = "NAD83")

# Check CRS
sf::st_crs(WYspplt)

# Set up projection
```

```
prj <- "+proj=utm +zone=12 +ellps=GRS80 +datum=NAD83 +units=m +no_defs"

# Use `spReprojectVector` to reproject the vector
WYspplt.utm12 <- spReprojectVector(layer = WYspplt,
                                  crs.new = prj)

# Check results
sf::st_crs(WYspplt.utm12)
```

---

spUnionPoly                      *Spatial - Generate a unioned sf object with polygons and attributes from two sf polygon objects.*

---

### Description

Generate a unioned sf object with polygons and attributes from two sf polygon objects.

### Usage

```
spUnionPoly(
  polyv1,
  polyv1_dsn = NULL,
  polyv2,
  polyv2_dsn = NULL,
  showext = FALSE,
  areacalc = FALSE,
  areavar = "ACRES_GIS",
  exportsp = FALSE,
  savedata_opts = NULL,
  ...
)
```

### Arguments

polyv1	sf R object or String. Polygon data to union. Can be a spatial polygon object, full pathname to a shapefile, or name of a layer within a database.
polyv1_dsn	String. Data source name (dsn; e.g., sqlite or shapefile pathname) of layer to union. The dsn varies by driver. See gdal OGR vector formats ( <a href="https://www.gdal.org/ogr_formats.html">https://www.gdal.org/ogr_formats.html</a> ). Optional if polyv1 is sf object.
polyv2	sf R object or String. Polygon data to union. Can be a spatial polygon object, full pathname to a shapefile, or name of a layer within a database.
polyv2_dsn	String. Data source name (dsn; e.g., sqlite or shapefile pathname) of layer to union. The dsn varies by driver. See gdal OGR vector formats ( <a href="https://www.gdal.org/ogr_formats.html">https://www.gdal.org/ogr_formats.html</a> ). Optional if polyv2 is sf object.
showext	Logical. If TRUE, layer extents are displayed in plot window.
areacalc	Logical. If TRUE, calculate area of unioned polygons and append to attribute table (See details).

areavar	String. Name of area variable.
exportsp	Logical. If TRUE, the spatial unioned object is exported to outfolder (see spExportSpatial for details).
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when export = TRUE. If out_layer = NULL, default = 'polyunion'.
...	For extensibility.

### Details

\*If variable = NULL, then it will prompt user for input.

Uses raster function union to merge two polygons and crop, if clip=TRUE. Generates a new ID for each polygon and appends attributes from both polygons.

areacalc

If areacalc = TRUE and the unioned spatial object is not in a projected coordinate system (i.e., longlat), the object will be reprojected to the Albers Equal Area projection before area is calculated.

### Value

sf object of unioned polygon. If polyv1 and polyv2 have different projections, the projection of returned object will have the same projection as poly1 (See note about on-the-fly projection conversion).

If exportsp=TRUE, the sf object will be written to outfolder (See note).

### Note

On-the-fly projection conversion

The spTransform (rgdal) method is used for on-the-fly map projection conversion and datum transformation using PROJ.4 arguments. Datum transformation only occurs if the +datum tag is present in the both the from and to PROJ.4 strings. The +towgs84 tag is used when no datum transformation is needed. PROJ.4 transformations assume NAD83 and WGS84 are identical unless other transformation parameters are specified. Be aware, providing inaccurate or incomplete CRS information may lead to erroneous data shifts when reprojecting. See spTransform help documentation for more details.

ESRI Shapefile Driver

If exportsp=TRUE:

The writeOGR (rgdal) function is called. If out\_fmt="shp", the ESRI Shapefile driver truncates variable names to 10 characters or less. Variable names are changed before export using an internal function (trunc10shp). If sf object has more than 1 record, it will be returned but not exported.

### Author(s)

Tracey S. Frescino

### Examples

```
## Not run:
# Set up data from `FIESTA` and `raster`
WYbhn <- system.file("extdata",
```

```

        "sp_data/WYbighorn_adminbnd.shp",
        package = "FIESTA")
WYbh <- spImportSpatial(WYbhfn)
USAc0 <- raster::getData("GADM", country = "USA", level = 2)

# Generate unioned `sf` object
polyUnion <- spUnionPoly(polyv1 = USAc0[USAc0$NAME_1 == "Wyoming",],
                          polyv2 = WYbh,
                          areacalc = TRUE)

# Plot the result
plot(sf::st_geometry(polyUnion))

## End(Not run)

```

---

spZonalRast

*Spatial - Extracts summary statistics by polygon (i.e., zone) for a raster.*

---

### Description

Extracts summary statistics by polygon, or zone for a raster (single or multi-band).

### Usage

```

spZonalRast(
  polyv,
  polyv_dsn = NULL,
  polyv.att = NULL,
  rastfn,
  rastfolder = NULL,
  bands = NULL,
  zonalstat,
  pixelfun = NULL,
  outname = NULL,
  showext = FALSE,
  rastlut = NULL,
  rast.NODATA = NULL,
  na.rm = TRUE,
  savedata = FALSE,
  savedata_opts = NULL
)

```

### Arguments

**polyv** sf R object or String. Polygon data to identify zones. Can be a spatial polygon object, full pathname to a shapefile, or name of a layer within a database.

polyv_dsn	String. Data source name (dsn; e.g., sqlite or shapefile pathname) of zonal layer. The dsn varies by driver. See gdal OGR vector formats ( <a href="https://www.gdal.org/ogr_formats.html">https://www.gdal.org/ogr_formats.html</a> ). Optional if polyv is sf object.
polyv.att	String. Name of attribute in polyv to identify zones for summarizing raster statistics.
rastfn	String or Raster. File name(s) with extensions, or raster object(s). Note: raster objects must be written to file.
rastfolder	String. Name of the folder with raster layers. Optional. Useful if all raster layers are in same folder.
bands	Numeric vector. If rast is a multi-layer raster and only 1 or some layers are desired, specify layer number(s) in a vector format. If NULL, all layers are summed.
zonalstat	String vector. Zonal statistic(s) to return for rasters with continuous data ("mean", "sum", "majority", "minority", "variety", "npixels") or rasters with discrete data ("count", "proportion").
pixelfun	Function. A function to apply to the individual pixel values before calculating sum and mean. The function should accept a single numeric argument (pixel value) and return a single numeric argument.
outname	String. Variable name for output. The output names will use outname as a prefix to summary statistics (i.e., 'outname'.mean, 'outname'.sum).
showext	Logical. If TRUE, layer extents are displayed in plot window.
rastlut	Data frame. A look up table to recode raster values. Must be 2 columns: Column 1 with raster values and column 2 with recode values.
rast.NODATA	Numeric. NODATA value or other values to ignore. These values will be removed from output zonal table. See notes below.
na.rm	Logical. If TRUE, Null values are removed before zonal statistic calculations.
savedata	Logical. If TRUE, the zonal data are saved to outfolder.
savedata_opts	List. See <code>help(savedata_options())</code> for a list of options. Only used when <code>savedata = TRUE</code> . If <code>out_layer = NULL</code> , default = 'zonalex'. = TRUE. If out_layer = NULL, default = 'zonalex'.

### Details

Use `spZonalRast()` to prompt for input.

If the projection of `polyv` is different than the projection of `rast`, the `polyv` `SpatialPolygons` object is converted to the projection of `rast` (See note about on-the-fly projection conversion).

### Value

zonalex	Data frame. Zonal statistics by polygon attribute (attribute).
outname	String vector. Names of zonal statistic variables generated in zonalex data frame.
rasterfile	String vector. Names of raster file(s) associated with zonal statistic.

If `savedata=TRUE`, `outdat` data frame is saved to outfolder (Default name: `zonalex_'date'.csv`).

**Note****rast.NODATA**

NODATA values are raster pixel values that have no data of interest, including pixels within the extent of the layer, but outside the area of interest. Sometimes these pixels have been defined previously. The defined NODATA pixels are imported to R as NULL values. When not previously defined, the pixels outside the area of interest will be the minimum or maximum value depending on the data type (e.g., 16-bit signed: min=-32,768; max=32,768) or byte size (1 byte: min=0; max=255). These NODATA values will be added to the zonal statistic calculations if not specified in rast.NODATA.

**On-the-fly projection conversion**

The spTransform (rgdal) method is used for on-the-fly map projection conversion and datum transformation using PROJ.4 arguments. Datum transformation only occurs if the +datum tag is present in the both the from and to PROJ.4 strings. The +towgs84 tag is used when no datum transformation is needed. PROJ.4 transformations assume NAD83 and WGS84 are identical unless other transformation parameters are specified. Be aware, providing inaccurate or incomplete CRS information may lead to erroneous data shifts when reprojecting. See spTransform help documentation for more details.

**Author(s)**

Tracey S. Frescino

**Examples**

```
# Set up data from `FIESTA`
WYbhdistfn <- system.file("extdata",
                          "sp_data/WYbighorn_districtbnd.shp",
                          package = "FIESTA")
demfn <- system.file("extdata",
                     "sp_data/WYbighorn_dem_250m.img",
                     package = "FIESTA")

# Import spatial data with `spImportSpatial`
WYbhdist <- spImportSpatial(WYbhdistfn)

# Extract mean and sum in `WYbhdist`
spZonalRast(polyv = WYbhdist,
             polyv.att = "DISTRICTNA",
             rastfn = demfn,
             zonalstat = c("mean", "sum"))
```

WYplt

*FIA data. Plot-level data from FIA public database.***Description**

FIA plot-level data for the state of Wyoming, inventory years 2011-2012 and was downloaded Sept 8, 2017 from FIADB\_1.7.0.00.

**Format**

A data frame with 24 columns and 6336 rows.

**Details**

<b>VARIABLE</b>	<b>DESCRIPTION</b>
CN	Unique FIADB identifier
PREV_PLT_CN	Previous unique FIADB identifier
INVYR	Inventory year
STATECD	State code (FIPS)
CYCLE	Inventory cycle number
SUBCYCLE	Inventory subcycle number (Do not use subcycle 99 for estimation)
UNITCD	Survey unit code
COUNTYCD	County code
PLOT	Phase 2 plot number (Public)
LON_PUBLIC	Longitude - fuzzed/swapped (Decimal degrees; NAD83)
LAT_PUBLIC	Latitude - fuzzed/swapped (Decimal degrees; NAD83)
PLOT_NONSAMPLE_REASN_CD	Plot nonsampled reason
SAMP_METHOD_CD	Sample method code
SUBP_EXAMINE_CD	Subplots examined code
MANUAL	Manual version number
INTENSITY	Intensity
MEASYEAR	Measurement year
MEASMON	Measurement month
MEASDAY	Measurement day
REMPER	Remeasurement period
DESIGNCD	Plot design
P2PANEL	Phase 2 panel number
SUBPANEL	Subpanel number
ELEV	Elevation (ft)
KINDCD	Sample kind
MORT_TYP_CD	Type of annual mortality volume (1:Current annual; 2:Periodic annual)
GROW_TYP_CD	Type of annual volume growth (1:Current annual; 2:Periodic annual)
NF_PLOT_NONSAMPLE_REASN_CD	Nonforest sampling status
P2VEG_SAMPLING_STATUS_CD	P2 vegetation sampling status
PLOT_STATUS_CD	Plot sampling status
NF_PLOT_STATUS_CD	Nonforest plot sampling status
NBRCND	DERIVED: Number of conditions for plot

NBRCNDFOR  
 FORNONSAMP  
 CCLIVEPLT  
 UNIQUEID

DERIVED: Number of different forest type conditions for plot  
 DERIVED: Plot status - sampled and nonsampled (Combination of PLOT\_NO  
 DERIVED: Percent cover of live trees for plot (LIVE\_CANOPY\_CVR\_PCT \*  
 DERIVED: Unique identifier for plot location ('Z'+STATECD(2)+UNITCD(2)

WYunitzonal

*Zonal data. Zonal means for auxiliary data in counties in Wyoming.*

---

**Description**

Zonal means and pixel counts for certain auxiliary data in counties in Wyoming. Includes county code variable to distinguish counties, and state code variable to distinguish states.

**Format**

A dataframe with 9 columns and 23 rows.
