

# Package ‘Monte.Carlo.se’

October 12, 2022

**Type** Package

**Title** Monte Carlo Standard Errors

**Version** 0.1.0

**Author** Dennis Boos, Kevin Matthew, Jason Osborne

**Maintainer** Dennis Boos <boos@ncsu.edu>

**Description** Computes Monte Carlo standard errors for summaries of Monte Carlo output. Summaries and their standard errors are based on columns of Monte Carlo simulation output. Dennis D. Boos and Jason A. Osborne (2015) <[doi:10.1111/insr.12087](https://doi.org/10.1111/insr.12087)>.

**License** GPL-3

**Encoding** UTF-8

**LazyData** true

**RoxygenNote** 6.1.1

**Suggests** knitr, rmarkdown

**VignetteBuilder** knitr

**NeedsCompilation** no

**Repository** CRAN

**Date/Publication** 2019-05-03 10:30:04 UTC

A.Quick.Outline

*Monte.Carlo.se: A package for computing standard errors of Monte Carlo estimates*

---

### Description

The Monte.Carlo.se package has two main R functions `mc.se.vector` and `mc.se.matrix` that are built on two basic functions `jack.se` and `boot.se` for computing jackknife and bootstrap standard errors, respectively.

### Details

A Monte Carlo Study often results in an N by k matrix X of estimates based on N independent samples of simulation data. X might contain parameter estimates (like the mean or median) or test results (say 0 for "accept the null hypothesis" or 1 for "reject the null"). Summary calculations from X, such as means or variances, are then displayed in a table or plot.

The purpose of the Monte.Carlo.se package is to compute estimates of the standard deviation (called standard errors) of these table entries.

Examples are included in the documentation for `mc.se.vector` and `mc.se.matrix`. However, more extended examples may be found in the three vignettes found by clicking "index" at the bottom of this page and then on "User guides, package vignettes and other documentation."

### Author(s)

Dennis Boos, Kevin Matthew, Jason Osborne

---

boot.se

*Bootstrap Standard Error*

---

### Description

`boot.se` – gives a bootstrap standard error (SE=estimated standard deviation)

### Usage

```
boot.se(x, B, theta, ...)
```

### Arguments

x	vector of data
B	number of bootstrap resamples (replications)
theta	function (statistic) applied to the data (e.g., mean, median, var)
...	Additional arguments to be passed

**Details**

The code was modified from code associated with the appendix of Efron and Tibshirani (1993)

**Value**

Returns the bootstrap SE of  $\theta(x)$

**Author(s)**

Dennis Boos, Kevin Matthew, Jason Osborne

out.t20.15 <- apply(z,1,mean,trim=0.20)
out.med.15 <- apply(z,1,median)

# The three datasets (out.m.15,out.t20.15,out.med.15) each contain 10000 values.
# If we want use the variance of each column in a table, then to get
# the Monte Carlo standard error of those 3 variances,

set.seed(250)
boot.se(out.m.15,B=1000,theta = var)
# [1] 0.0009373835

boot.se(out.t20.15,B=1000,theta = var)
# [1] 0.0007086057

boot.se(out.med.15,B=1000,theta = var)
# [1] 0.0008307258
# ends donttest
# Function Code

boot.se<-function(x, B, theta, ...){
  call <- match.call()
  n <- length(x)
  bootsam <- matrix(sample(x, size = n * B, replace = T), nrow = B)
  thetastar <- apply(bootsam, 1, theta, ...)
  se <- sd(thetastar)
  return(se)
}

```

**Description**

Auxiliary functions to be used in the MonteCarlo.se package, mainly with mc.se.matrix. Scroll down to the Examples Section to see the actual code.

**Usage**

```
ratio.var(index, xdata)
ratio.sd(index, xdata)
ratio.mse(index, xdata, true)
ratio.mean.vhat.var(index, xdata)
ratio.mean.sdhat.sd(index, xdata)
corr(index, xdata)
cv(x)
varn(x, n)
jack.var(x, theta, ...)
boot.var(x, B, theta, ...)
```

**Arguments**

index	index = usually of the form 1:N
xdata	actual data
true	true parameter value when computing mean squared error
x	Input vector in calls to jack.var and boot.var
n	sample size
theta	theta = function in calls to jack.var and boot.var
...	Additional arguments to be passed
B	Bootstrap reps in calls to boot.var

**Author(s)**

Dennis Boos, Kevin Matthew, Jason Osborne

**Examples**

```
# These are extra functions included in the MCse package
# The following functions are to be used with mc.se.matrix

ratio.var <- function(index,xdata)      # ratio of variances
```

```

{var(xdata[index,1])/var(xdata[index,2])}

# The above function is for the ratio of the sample variance of column 1 to
# the sample variance of column 2 of xdata.
# Note that the actual data goes into xdata, the second argument of ratio.var.
# Example call for 10,000 means and medians:
# ratio.var(1:10000,xdata=cbind(out.m.15,out.med.15))

ratio.sd<-function(index,xdata){          # ratio of standard deviations
  sd(xdata[index,1])/sd(xdata[index,2])}

ratio.mse<-function(index,xdata,true){    # ratio of mean squared errors
  mean((xdata[index,1]-true)^2)/mean((xdata[index,2]-true)^2)}

ratio.mean.vhat.var<-function(index,xdata){# estimates in col 1, v hats in col. 2
  mean(xdata[index,2])/var(xdata[index,1])}

ratio.mean.sdhat.sd<-function(index,xdata){# estimates in col 1, SEs in col. 2
  mean(xdata[index,2])/sd(xdata[index,1])}

corr<-function(index,xdata){             # simple correlation
  cor(xdata[index,1],xdata[index,2])}

# These next two functions correspond to jack.se and boot.se.
# x is a data vector, and theta is a function applied to x.
# Each returns a variance estimate for theta(x).

jack.var <- function(x, theta, ...){ # jackknife estimate of variance
  n <- length(x)
  u <- rep(0, n)
  for(i in 1:n){u[i] <- theta(x[ - i], ...)}
  jack.var <- ((n-1)/n)* sum((u-mean(u))^2)
  return(jack.var)}

boot.var <- function(x,B,theta, ...){ # bootstrap estimate of variance
  n <- length(x)
  bootsam <- matrix(sample(x,size = n*B,replace=T), nrow=B)
  thetastar <- apply(bootsam,1,theta,...)
  boot.var <- var(thetastar)
  return(boot.var)}

```

---

jack.se

*Jackknife Standard Error*

---

### Description

jack.se — gives jackknife standard error (SE=estimated standard deviation)

**Usage**

```
jack.se(x, theta, ...)
```

**Arguments**

x	vector of data
theta	— function (statistic) applied to the data (e.g., mean, median, var)
...	Additional arguments to be passed

**Details**

The code was modified from code associated with the appendix of Efron and Tibshirani (1993)

**Value**

Returns the jackknife standard error of theta(x)

**Author(s)**

Dennis Boos, Kevin Matthew, Jason Osborne

  return(jack.se)}

```

---

mc.se.matrix	<i>Standard Errors for Summaries Based on 2 or More Vectors of Monte Carlo Output</i>
--------------	---

---

**Description**

mc.se.matrix — jackknife and bootstrap SEs for statistics based on k correlated samples

**Usage**

```
mc.se.matrix(x, xcol, B = 0, seed = NULL, summary.f, ...)
```

**Arguments**

x	N by k matrix or data frame of MC output, k>1
xcol	vector specifying columns of x to use
B	B=0 (default) means use jackknife, B>0 means use bootstrap with B resamples, If B>0, then a seed must be given to start the bootstrap resampling
seed	seed=NULL (default) used with jackknife, otherwise needs positive integer
summary.f	summary function with arguments (index,xdata), x goes into xdata
...	Additional arguments to be passed

**Details**

Suppose that k columns of Monte Carlo output are produced from N independent Monte Carlo samples, and summary statistics involving 2 or more columns are to be reported in tables. mc.se.matrix gives Monte Carlo standard errors (SEs) for these summary statistics (e.g., the ratio of 2 column means or variances). The vignette `vignette("Example2", package = "Monte.Carlo.se")` is a detailed account of using mc.se.vector.

**Value**

Returns data frame of summary.f, Monte Carlo (MC) SE of summary.f, MC sample size N, method (jackknife or bootstrap), B and seed if bootstrap is used

**Author(s)**

Dennis Boos, Kevin Matthew, Jason Osborne

mc.se.vector

*Standard Errors for Monte Carlo Output Summaries*

---

## Description

mc.se.vector — gives jackknife and bootstrap SEs for a vector of MC output (say N estimates)

## Usage

```
mc.se.vector(x, summary.f, B = 0, seed = NULL, ...)
```

## Arguments

x	vector from N independent Monte Carlo replications
summary.f	summary function computed from x (e.g., mean, median, var)
B	B=0 means use jackknife (default), B>0 means use bootstrap with B resamples, If B>0, then a seed must be given to start the bootstrap resampling
seed	seed=NULL (default) used with jackknife, otherwise needs a positive integer
...	Additional arguments to be passed

**Details**

Suppose that an  $N$ -vector of Monte Carlo output (thus, a sample of size  $N$ ) is produced from  $N$  independent Monte Carlo samples, and a summary statistic like the mean or variance is to be reported in a table. `mc.se.vector` gives Monte Carlo standard errors (SEs) for these summary statistics. The vignette `vignette("Example1", package = "Monte.Carlo.se")` is a detailed account of using `mc.se.vector`.

**Value**

Returns data frame of `summary.f`, MC standard error of `summary.f`, MC sample size  $N$ , method (jackknife or bootstrap),  $B$  and seed if bootstrap is used

  return(out)}

```

**Description**

`pairwise.se` — gives jackknife and bootstrap SEs for all the pairwise difference or ratios of Monte Carlo summaries.

**Usage**

```
pairwise.se(x, xcol, diff = TRUE, digits = 4, B = 0, seed = NULL,
            summary.f, ...)
```

**Arguments**

<code>x</code>	vector from N independent Monte Carlo replications
<code>xcol</code>	columns of <code>x</code> to be used
<code>diff</code>	If TRUE (default), uses differences; if <code>diff=F</code> , uses ratios
<code>digits</code>	number of digits to retain in output data frame
<code>B</code>	<code>B=0</code> means use jackknife (default), <code>B&gt;0</code> means use bootstrap with B resamples, If <code>B&gt;0</code> , then a seed must be given to start the bootstrap resampling
<code>seed</code>	<code>seed=NULL</code> (default) used with jackknife, otherwise needs a positive integer
<code>summary.f</code>	summary function computed from <code>x</code> (e.g., mean, median, var)
<code>...</code>	Additional arguments to be passed

**Details**

Suppose that an N-vector of Monte Carlo output (thus, a sample of size N) is produced from N independent Monte Carlo samples, and a summary statistic like the mean or variance is to be reported in a table. `pairwise.se` gives Monte Carlo standard errors (SEs) for all pairwise differences or ratios of these summary statistics. The vignette `vignette("Example3", package = "Monte.Carlo.se")` is a detailed account of using `pairwise.se`.

**Value**

Returns a data frame of the individual *i*th and *j*th column summaries (`summi` and `summj`), the differences or ratios of those summaries (`summary`), MC standard error of the difference or ratio, MC sample size N, method (jackknife or bootstrap), B and seed if bootstrap is used

**Author(s)**

Dennis Boos, Kevin Matthew, Jason Osborne

**Examples**

```
# Using the output data matrix hold generated in vignette Example3,
# calculate jackknife and bootstrap standard errors
# for the differences and ratios of the CV estimates.

# Jackknife SE of Differences of CVs
```

```

pairwise.se(hold,xcol=10:12,summary.f=cv)
# elem summi summj summary se t.stat N method
# 1 10 11 0.6884 0.7030 -0.0146 0.0299 -0.4877 1000 Jackknife
# 2 10 12 0.6884 0.6489 0.0395 0.0195 2.0274 1000 Jackknife
# 3 11 12 0.7030 0.6489 0.0541 0.0311 1.7374 1000 Jackknife

# Jackknife SE of Ratios of CVs

---

sim.samp

*Code for Generating Random Samples*

---

## Description

sim.samp — generates N samples of size n from distribution DIST

## Usage

```
sim.samp(nrep, n, DIST, ...)
```

## Arguments

nrep	= number of random data sets
n	= sample size of each data set
DIST	= distribution to generate from, e.g., runif, rnorm, additional parameters in ...
...	Additional arguments to be passed

**Value**

N by n matrix, each row is a data set of size n

**Author(s)**

Dennis Boos, Kevin Matthew, Jason Osborne

**Examples**

```
N<-100
set.seed(346)          # sets the random number seed
sim.samp(N,15,rnorm)->z # 100 N(0,1) samples of size n=15
sim.samp(N,40,rnorm,mean=10,sd=5)->z # 100 N(10,25) samples of size n=40

# Function Code

sim.samp <- function(nrep,n,DIST,...){
  data <- matrix(DIST(n * nrep, ...), ncol = n, nrow = nrep)}
```
