Package 'SwimmeR'

October 12, 2022

Title Data Import, Cleaning, and Conversions for Swimming Results

Version 0.13.0

Description The goal of the 'SwimmeR' package is to provide means of acquiring, and then analyzing, data from swimming (and diving) competitions. To that end 'SwimmeR' allows results to be read in from .html sources, like 'Hy-Tek' real time results pages, '.pdf' files, 'ISL' results, 'Omega' results, and (on a development basis) '.hy3' files. Once read in, 'SwimmeR' can convert swimming times (performances) between the computationally useful format of seconds reported to the '100ths' place (e.g. 95.37), and the conventional reporting format (1:35.37) used in the swimming community. 'SwimmeR' can also score meets in a variety of formats with user defined point values, convert times between courses ('LCM', 'SCM', 'SCY') and draw single elimination brackets, as well as providing a suite of tools for working cleaning swimming data. This is a developmental package, not yet mature.

R topics documented:

`add_row_numbers` *Add row numbers to raw results*

Description

Takes the output of `read_results` and adds row numbers to it

Usage

```
add_row_numbers(text)
```

Arguments

`text`	output from `read_results`

Value

returns a data frame with event names and row numbers to eventually be recombined with swimming results inside `swim_parse`

See Also

add_row_numbers is a helper function inside swim_parse

---

age_format *Formatting yyy-mm ages as years*

Description

Takes a character string (or list) representing an age as years-months (e.g. 13-06 for 13 years, 6 months) and converts it to a character value (13.5) or a list of values representing ages in years.

Usage

```
age_format(x)
```

Arguments

x	A character vector of ages in yyy-mm format (e.g. 93-03) to be converted to years (93.25)

Value

returns the value of the string x which represents an age in yyy-mm format (93-03) and converts it to years (93.25)

See Also

age_format_helper age_format uses age_format_helper

Examples

```
age_format("13-06")
age_format(c("13-06", "25-03", NA))
```

`age_format_helper` *Helper function for formatting yyy-mm ages as years, enables vectorization of* `age_format`

Description

Helper function for formatting yyy-mm ages as years, enables vectorization of `age_format`

Usage

```
age_format_helper(x)
```

Arguments

`x`	A character vector of age(s) in yyyy-mm format (e.g. 13-06) to be converted to years (13.5)

`coalesce_many` *Combined paired sets of columns following a join operation*

Description

Combined paired sets of columns following a join operation

Usage

```
coalesce_many(df)
```

Arguments

`df`	a data frame following a join and thereby containing paired columns of the form Col_1.x, Col_1.y

Value

returns a data frame with all sets of paired columns combined into single columns and named as, for example, Col_1, Col_2 etc.

See Also

`coalesce_many` runs inside `swim_parse_splash`

coalesce_many_helper *Combined paired sets of columns following a join operation*

Description

This function is intended to be mapped over a sequence `i` inside the function `coalesce_many`

Usage

```
coalesce_many_helper(df, new_split_names, i)
```

Arguments

`df`	a data frame following a join and thereby containing paired columns of the form Col_1.x, Col_1.y
`new_split_names`	a list of desired column names, e.g. Col_1, Col_2
`i`	a number between 1 and the length of `new_split_names`

Value

returns a data frame with one set of paired columns combined into a single column and named based on `new_split_names`

See Also

`coalesce_many_helper` runs inside `coalesce_many`

collect_relay_swimmers *Collects relay swimmers as a data frame within* `swim_parse`

Description

Collects relay swimmers as a data frame within `swim_parse`

Usage

```
collect_relay_swimmers(x)
```

Arguments

`x`	output from `read_results` followed by `add_row_numbers`

Value

returns a data frame of relay swimmers and the associated performance row number

See Also

`collect_relay_swimmers_data` runs inside of `swim_parse`

---

collect_relay_swimmers_old

Collects relay swimmers as a data frame within `swim_parse_old`

Description

Depreciated version associated with depreciated version of `swim_parse_old`

Usage

```
collect_relay_swimmers_old(x, typo_2 = typo, replacement_2 = replacement)
```

Arguments

`x`	output from `read_results` followed by `add_row_numbers`
`typo_2`	list of typos from `swim_parse`
`replacement_2`	list of replacements for typos from `swim_parse`

Value

returns a data frame of relay swimmers and the associated performance row number

See Also

`collect_relay_swimmers` runs inside of `swim_parse`

---

collect_relay_swimmers_omega

Collects relay swimmers as a data frame within `swim_parse_omega`

Description

Collects relay swimmers as a data frame within `swim_parse_omega`

Usage

```
collect_relay_swimmers_omega(x)
```

Arguments

x	output from read_results followed by add_row_numbers

Value

returns a data frame of relay swimmers and the associated performance row number

See Also

collect_relay_swimmers_data runs inside of swim_parse_omega

---

collect_relay_swimmers_splash

Collects relay swimmers as a data frame within swim_parse_splash

---

Description

Collects relay swimmers as a data frame within swim_parse_splash

Usage

```
collect_relay_swimmers_splash(x, relay_indent = Indent_Length)
```

Arguments

x	output from read_results followed by add_row_numbers
relay_indent	the number of spaces relay swimmer lines are indented compared to regular swimmer lines

Value

returns a data frame of relay swimmers and the associated performance row number

See Also

collect_relay_swimmers_data runs inside of swim_parse_splash

`correct_split_distance` *Changes lengths associated with splits to new values*

Description

Useful for dealing with meets where some events are split by 50 and others by 25.

Usage

```
correct_split_distance(df, new_split_length, events)

correct_split_length(df, new_split_length, events)
```

Arguments

`df`	a data frame having some split columns (Split_50, Split_100 etc.)
`new_split_length`	split length to rename split columns based on
`events`	list of events to correct splits for

Value

a data frame where all events named in the `events` parameter have their split column labels adjusted to reflect `new_split_length`

Examples

```
df <- data.frame(Name = c("Lilly King", "Caeleb Dressel"),
Event = c("Women 100 Meter Breaststroke", "Men 50 Yard Freestyle"),
Split_50 = c("29.80", "8.48"),
Split_100 = c("34.33", "9.15"))

df %>% correct_split_distance(
 new_split_length = 25,
 events = c("Men 50 Yard Freestyle")
)
```

`correct_split_distance_helper` *Changes lengths associated with splits to new values*

Description

Useful for dealing with meets where some events are split by 50 and others by 25.

Usage

```
correct_split_distance_helper(df_helper, new_split_length_helper)
```

Arguments

`df_helper`	a data frame having some split columns (Split_50, Split_100 etc.)
`new_split_length_helper`	split length to rename split columns based on

Value

a data frame where all values have been pushed left, replacing 'NA's, and all columns containing only 'NA's have been removed

See Also

`correct_split_distance_helper` is a helper function inside `correct_split_distance`

`course_convert` *Swimming Course Convertor*

Description

Used to convert times between Long Course Meters, Short Course Meters and Short Course Yards

Usage

```
course_convert(time, event, course, course_to, verbose = FALSE)
```

Arguments

time	A time, or vector of times to convert. Can be in either seconds (numeric, 95.97) format or swim (character, "1:35.97") format
event	The event swum as "100 Fly", "200 IM", "400 Free", "50 Back", "200 Breast" etc.
course	The course in which the time was swum as "LCM", "SCM" or "SCY"
course_to	The course to convert the time to as "LCM", "SCM" or "SCY"
verbose	If TRUE will return a data frame containing columns • Time • Course • Course_To • Event • Time_Converted_sec • Time_Converted_mmss . If FALSE (the default) will return only a converted time.

Value

returns the time for a specified event and course converted to a time for the specified course_to in swimming format OR a data frame containing columns

- Time
- Course
- Course_To
- Event
- Time_Converted_sec
- Time_Converted_mmss

depending on the value of verbose

Note

Relays are not presently supported.

References

Uses the USA swimming age group method described here: https://support.teamunify.com/en/articles/260

Examples

```
course_convert(time = "1:35.93", event = "200 Free", course = "SCY", course_to = "LCM")
course_convert(time = 95.93, event = "200 Free", course = "scy", course_to = "lcm")
course_convert(time = 53.89, event = "100 Fly", course = "scm", course_to = "scy")
```

`course_convert_DF` *Course converter, returns data frame - defunct*

Description

Used to convert times between Long Course Meters, Short Course Meters and Short Course Yards, returns data frame

Usage

```
course_convert_DF(time, event, course, course_to)

course_convert_df(time, event, course, course_to)
```

Arguments

`time`	A time, or vector of times to convert. Can be in either seconds (numeric, `95.97`) format or swim (character, `"1:35.97"`) format
`event`	The event swum as `"100 Fly"`, `"200 IM"`, `"400 Free"`, `"50 Back"`, `"200 Breast"` etc.
`course`	The course in which the time was swum as `"LCM"`, `"SCM"` or `"SCY"`
`course_to`	The course to convert the time to as `"LCM"`, `"SCM"` or `"SCY"`

Value

This function returns a data frame including columns:

- Time
- Course
- Course_To
- Event
- Time_Converted_sec
- Time_Converted_mmss

Note

Relays are not presently supported.

References

Uses the USA swimming age group method described here https://support.teamunify.com/en/articles/260

`course_convert_helper` *Swimming Course Convertor Helper*

Description

Used to convert times between Long Course Meters, Short Course Meters and Short Course Yards

Usage

```
course_convert_helper(time, event, course, course_to, verbose = FALSE)
```

Arguments

`time`	A time, or vector of times to convert. Can be in either seconds (numeric, `95.97`) format or swim (character, `"1:35.97"`) format
`event`	The event swum as `"100 Fly"`, `"200 IM"`, `"400 Free"`, `"50 Back"`, `"200 Breast"` etc.
`course`	The course in which the time was swum as `"LCM"`, `"SCM"` or `"SCY"`
`course_to`	The course to convert the time to as `"LCM"`, `"SCM"` or `"SCY"`
`verbose`	If `TRUE` will return a data frame containing columns • Time • Course • Course_To • Event • Time_Converted_sec • Time_Converted_mmss . If `FALSE` (the default) will return only a converted time.

Value

returns the `time` for a specified `event` and `course` converted to a time for the specified `course_to` in swimming format OR a data frame containing columns

- Time
- Course
- Course_To
- Event
- Time_Converted_sec
- Time_Converted_mmss

depending on the value of `verbose`

See Also

`course_convert_helper` is a helper function inside `course_convert`

determine_indent_length_splash *Determines indent length for data within* swim_parse_splash

Description

In Splash results there are two line types that are of interest and don't begin with either a place or a special string (DNS, DSQ etc.). These are ties and relays swimmers. Relay swimmers are indented further than ties. This function determines the number of spaces, called indent length, prior to a tie row, plus a pad of four spaces.

Usage

```
determine_indent_length_splash(x, time_score_string)
```

Arguments

x	output from read_results followed by add_row_numbers
time_score_string	a regular expression as a string that describes swimming times and diving scores

Value

returns a number indicating the number of spaces preceding an athlete's name in a tie row

See Also

determine_indent_length_splash runs inside of swim_parse_splash

discard_errors *Discards elements of list that have an error value from* purrr::safely.

Description

Used in scrapping, when swim_parse is applied over a list of results using purrr::map the result is a list of two element lists. The first element is the results, the second element is an error register. This function removes all elements where the error register is not NULL, and then returns the results (first element) of the remaining lists.

Usage

```
discard_errors(x)
```

Arguments

x	a list of lists from purrr::map and purrr:safely

Value

a list of lists where sub lists containing a non-NULL error have been discarded and error elements have been removed from all remaining sub lists

Examples

```
result_1 <- data.frame(result = c(1, 2, 3))
error <- NULL

list_1 <- list(result_1, error)
names(list_1) <- c("result", "error")

result_2 <- data.frame(result = c(4, 5, 6))
error <- "result is corrupt"

list_2 <- list(result_2, error)
names(list_2) <- c("result", "error")

list_of_lists <- list(list_1, list_2)
discard_errors(list_of_lists)
```

---

dive_place *Adds places to diving results*

Description

Places are awarded on the basis of score, with highest score winning. Ties are placed as ties (both athletes get 2nd etc.)

Usage

```
dive_place(df, max_place)
```

Arguments

df	a data frame with results from swim_parse, including only diving results (not swimming)
max_place	highest place value that scores

Value

data frame modified so that places have been appended based on diving score

See Also

`dive_place` is a helper function used inside of `results_score`

`draw_bracket` *Creates a bracket for tournaments involving 5 to 64 teams, single elimination*

Description

Will draw a single elimination bracket for the appropriate number of teams, inserting first round byes for higher seeds as needed

Usage

```
draw_bracket(
  teams,
  title = "Championship Bracket",
  text_size = 0.7,
  round_two = NULL,
  round_three = NULL,
  round_four = NULL,
  round_five = NULL,
  round_six = NULL,
  champion = NULL
)
```

Arguments

`teams`	a list of teams, ordered by desired seed, to place in bracket. Must be between 5 and 64 inclusive. Teams must have unique names
`title`	bracket title
`text_size`	number passed to `cex` in plotting
`round_two`	a list of teams advancing to the second round (need not be in order)
`round_three`	a list of teams advancing to the third round (need not be in order)
`round_four`	a list of teams advancing to the forth round (need not be in order)
`round_five`	a list of teams advancing to the fifth round (need not be in order)
`round_six`	a list of teams advancing to the fifth round (need not be in order)
`champion`	the name of the overall champion team (there can be only one)

Value

a plot of a bracket for the teams, with results and titles as specified

References

based on `draw.bracket` from the seemingly now defunct `mRchmadness` package by Eli Shayer and Saber Powers and used per the terms of that package's GPL-2 license

Examples

```
## Not run:
teams <- c("red", "orange", "yellow", "green", "blue", "indigo", "violet")
round_two <- c("red", "yellow", "blue", "indigo")
round_three <- c("red", "blue")
champion <- "red"
draw_bracket(teams = teams,
             round_two = round_two,
             round_three = round_three,
             champion = champion)

## End(Not run)
```

`event_parse` *Pulls out event labels from text*

Description

Locates event labels in text of results output from `read_results` and their associated row numbers. The resulting data frame is joined back into results to include event names

Usage

```
event_parse(text)
```

Arguments

`text`	output from `read_results` followed by `add_row_numbers`

Value

returns a data frame with event names and row numbers to eventually be recombined with swimming results inside `swim_parse`

See Also

`event_parse` is a helper function inside `swim_parse`

event_parse_ISL *Pulls out event labels from text*

Description

Locates event labels in text of 'ISL' results output from `read_results` and their associated row numbers. The resulting data frame is joined back into results to include event names

Usage

```
event_parse_ISL(text)
```

Arguments

`text`	output from `read_results` followed by `add_row_numbers`

Value

returns a data frame with event names and row numbers to eventually be recombined with swimming results inside `swim_parse_ISL`

See Also

`event_parse_ISL` is a helper function inside `swim_parse_ISL`

fill_down *Fills NA values with previous non-NA value*

Description

This is a base approximation of `tidyr::fill()`

Usage

```
fill_down(x)
```

Arguments

`x`	a list having some number of non-NA values

Value

a list where NA values have been replaced with the closest previous non-NA value

See Also

`fill_down` is a helper function inside `lines_sort`

fill_left *Shifts non-NA values to left in data frame*

Description

Moves non-NA data left into NA spaces, then removes all columns that contain only NA values

Usage

```
fill_left(df)
```

Arguments

df	a data frame having some 'NA' values

Value

a data frame where all values have been pushed left, replacing 'NA's, and all columns containing only 'NA's have been removed

See Also

`fill_left` is a helper function inside `lines_sort` and `splits_parse`

fold *Fold a vector onto itself*

Description

Fold a vector onto itself

Usage

```
fold(x, block.size = 1)
```

Arguments

x	a vector
block.size	the size of groups in which to block the data

Value

a new vector in the following order: first block, last block, second block, second-to-last block, ...

References

from the seemingly now defunct `mRchmadness` package by Eli Shayer and Saber Powers and used per the terms of that package's GPL-2 license

format_results *Formats data for analysis within* swim_parse

Description

Takes the output of read_results and, inside of swim_parse, removes "special" strings like DQ and SCR from results, replacing them with NA. Also ensures that all athletes have a Finals_Time, by moving over Prelims_Time. This makes later analysis much easier.

Usage

```
format_results(df)
```

Arguments

df	a data frame of results at the end of swim_parse

Value

returns a formatted data frame

See Also

splits_parse runs inside swim_parse on the output of read_results with row numbers from add_row_numbers

get_mode *Find the mode (most commonly occurring) element of a list*

Description

Determines which element of list appears most frequently. Based on base::which.max(), so if multiple values appear with the same frequency will return the first one. Ignores NA values. In the context of swimming data is often used to clean team names, as in the Lilly King example below.

Usage

```
get_mode(x, type = "first")
```

Arguments

x	A list. NA elements will be ignored.
type	a character string of either "first" or "all" which determines behavior for ties. Setting type = "first" (the default) will return the element that appears most often and appears first in list x. Setting type = "all" will return all elements that appear most frequently.

Value

the element of x which appears most frequently. Ties go to the lowest index, so the element which appears first.

Examples

```
a <- c("a", "a", "b", "c")
get_mode(a)
ab <- c("a", "a", "b", "b", "c") # returns "a", not "b"
get_mode(ab)
#' ab <- c("a", "a", "b", "b", "c") # returns "a" and "b"
get_mode(ab, type = "all")
a_na <- c("a", "a", NA, NA, "c")
get_mode(a_na)
numbs <- c(1, 1, 1, 2, 2, 2, 3, NA)
get_mode(numbs, type = "all")

Name <- c(rep("Lilly King", 5))
Team <- c(rep("IU", 2), "Indiana", "IUWSD", "Indiana University")
df <- data.frame(Name, Team, stringsAsFactors = FALSE)
df$Team <- get_mode(df$Team)
```

---

heat_parse_omega *Pulls out heat labels from text*

Description

Locates heat labels in text of results output from `read_results` and their associated row numbers. The resulting data frame is joined back into results to include heat numbers

Usage

```
heat_parse_omega(text)
```

Arguments

`text`	output from `read_results` followed by `add_row_numbers`

Value

returns a data frame with heat names and row numbers to eventually be recombined with swimming results inside `swim_parse_omega`

See Also

`heat_parse_omega` is a helper function inside `swim_parse_omega`

hy3_parse *Parses Hy-Tek .hy3 files*

Description

Helper function used inside ‘swim_parse‘ for dealing with Hy-Tek .hy3 files. Can have more columns than other ‘swim_parse‘ outputs, because .hy3 files can contain more data

Usage

```
hy3_parse(
  file,
  avoid = avoid_minimal,
  typo = typo_default,
  replacement = replacement_default
)
```

Arguments

file	output from read_results
avoid	a list of strings. Rows in x containing these strings will not be included. For example "Pool:", often used to label pool records, could be passed to avoid. The default is avoid_default, which contains many strings similar to "Pool:", such as "STATE:" and "Qual:". Users can supply their own lists to avoid.
typo	a list of strings that are typos in the original results. swim_parse is particularly sensitive to accidental double spaces, so "Central High School", with two spaces between "Central" and "High" is a problem, which can be fixed. Pass "Central High School" to typo. Unexpected commas as also an issue, for example "Texas, University of" should be fixed using typo and replacement
replacement	a list of fixes for the strings in typo. Here one could pass "Central High School" (one space between "Central" and "High") and "Texas" to replacement fix the issues described in typo

Value

returns a data frame with columns Name, Place, Age, Team, Prelims_Time, Finals_Time, & Event. May also contain Seed_Time, USA_ID, and/or Birthdate. Note all swims will have a Finals_Time, even if that time was actually swam in the prelims (i.e. a swimmer did not qualify for finals). This is so that final results for an event can be generated from just one column.

See Also

parse_hy3 must be run on the output of read_results

parse_hy3 runs inside of swim_parse

hy3_places *Helper for reading prelims and finals places from Hy-Tek .hy3 files*

Description

Used to pull prelims and finals places from .hy3 files as part of parsing them.

Usage

```
hy3_places(
  file,
  type = c("prelims", "relay_prelims", "finals", "relay_finals")
)
```

Arguments

file	an output of read_results, from an .hy3 file
type	type of times, either "prelims", "relay_prelims", "finals" or "relay_finals"

Value

a data frame where column 1 is times and column 2 is row number

See Also

hy3_places is run inside of hy3_parse

hy3_times *Helper for reading prelims and finals times from Hy-Tek .hy3 files*

Description

Used to pull prelims and finals times from .hy3 files as part of parsing them.

Usage

```
hy3_times(file, type = c("prelims", "relay_prelims", "finals", "relay_finals"))
```

Arguments

file	an output of read_results, from an .hy3 file
type	type of times, either "prelims", "relay_prelims", "finals" or "relay_finals"

Value

a data frame where column 1 is times and column 2 is row number

See Also

hy3_times is run inside of hy3_parse

---

interleave_results *Helper for reading interleaving prelims and finals results*

Description

Interleaves times or places based on row number ranges.

Usage

```
interleave_results(entries, results, type = c("individual", "relay"))
```

Arguments

entries	a data frame containing columns for minimum and maximum row number (usually 'Row_Min' and 'Row_Max'). Times or places will be interleaved into this data frame.
results	a data frame containing times (or places) in column 1 (or other values to be interleaved) and row numbers in column 2 (usually 'Row_Numb').
type	either "individual" or "relay"

Value

a modified version of 'entries' with values from 'results' interleaved on the basis of row number

See Also

interleave_results is a helper function used in hy3_parse

---

is_link_broken *Determines if a link is valid*

Description

Used in testing links to external data, specifically inside of internal package tests. Attempts to connect to link for the length of duration (in s). If it fails it returns FALSE

Usage

```
is_link_broken(link_to_test, duration = 1)
```

Arguments

link_to_test	a link
duration	the lowest row number

Value

TRUE if the link works, FALSE if it fails

King200Breast *Results for Lilly King's 200 Breaststrokes*

Description

Lilly King's 200 Breaststroke swims from her NCAA career

Usage

```
data(King200Breast)
```

Format

An object of class "data.frame"

Source

NCAA Times Database

---

lines_sort *Sorts and collects lines by performance and row number*

Description

Collects all lines, (for example containing splits or relay swimmers) associated with a particular performance (a swim) into a data frame with the appropriate row number for that performance

Usage

```
lines_sort(x, min_row = minimum_row, to_wide = TRUE)
```

Arguments

x	a list of character strings including performances, with tow numbers added by add_row_numbers
min_row	the lowest row number
to_wide	should the data frame x be converted to wide format? Default is TRUE as used in Hytek and Omega results. Use FALSE in Splash results

Value

a data frame with Row_Numb as the first column. Other columns are performance elements, like splits or relay swimmers, both in order of occurrence left to right

See Also

lines_sort is a helper function inside splits_parse and swim_parse_ISL

---

list_transform *Transform list of lists into data frame*

Description

Converts list of lists, with all sub-lists having the same number of elements into a data frame where each sub-list is a row and each element a column

Usage

```
list_transform(x)
```

Arguments

x	a list of lists, with all sub-lists having the same length

Value

a data frame where each sub-list is a row and each element of that sub-list is a column

See Also

list_transform is a helper function used inside of swim_parse, swim_parse_ISL, event_parse and event_parse_ISL

---

mmss_format *Formatting seconds as mm:ss.hh*

Description

Takes a numeric item or list of numeric items representing seconds (e.g. 95.37) and converts to a character string or list of strings in swimming format ("1:35.37").

Usage

```
mmss_format(x)
```

Arguments

x	A number of seconds to be converted to swimming format

Value

the number of seconds x converted to conventional swimming format mm:ss.hh

See Also

sec_format mmss_format is the reverse of sec_format

Examples

```
mmss_format(95.37)
mmss_format(200.95)
mmss_format(59.47)
mmss_format(c(95.37, 200.95, 59.47, NA))
```

---

name_reorder *Orders all names as "Firstname Lastname"*

Description

Names are sometimes listed as Firstname Lastname, and sometimes as Lastname, Firstname. The names_reorder function converts all names to Firstname Lastname based on comma position. The reverse, going to Lastname, Firstname is not possible because some athletes have multiple first names or multiple last names and without the comma to differentiate between the two a distinction cannot be made.

Usage

```
name_reorder(x, verbose = FALSE)
```

Arguments

x	a data frame output from swim_parse containing a column called Name with some names as Lastname, Firstname
verbose	defaults to FALSE. If set to TRUE and if x is a data frame then returned data frame will include columns First_Name and Last_Name extracted as best as possible from Name

Value

a data frame with a column Name_Reorder, or a list, containing strings reordered as Firstname Lastname in addition to all other columns in input df. Can also contain columns First_Name and Last_Name depending on value of verbose argument

Examples

```
name_reorder(
data.frame(
Name = c("King, Lilly",
 "Lilly King",
 NA,
 "Richards Ross, Sanya",
 "Phelps, Michael F")),
verbose = TRUE
)
name_reorder(c("King, Lilly", "Lilly King", NA, "Richards Ross, Sanya"))
```

---

na_pad *Pads shorter lists in a list-of-lists with* NA*s such that all lists are the same length*

Description

Adds NA values to the end of each list in a list of lists such that they all become the length of the longest list. The longest list will not have any NAs added to it.

Usage

```
na_pad(x, y)
```

Arguments

x	a list of lists, with sub-lists having different lengths
y	a list of the nubmer of NA values to append to each sub-list

Value

a list of lists with each sub-list the same length

---

reaction_times_parse *Pulls out reaction times from text*

Description

Locates reaction times in text of results output from `read_results` and their associated row numbers. The resulting data frame is joined back into results to include reaction times

Usage

```
reaction_times_parse(text)
```

Arguments

text	output from read_results followed by add_row_numbers

Value

returns a data frame with reaction times and row numbers to eventually be recombined with swimming results inside swim_parse

See Also

reaction_times_parse is a helper function inside swim_parse

Read_Results *Reads swimming and diving results into a list of strings in preparation for parsing with* swim_parse

---

Description

Outputs list of strings to be processed by swim_parse

Usage

```
Read_Results(file, node = "pre")

read_results(file, node = "pre")
```

Arguments

file	a .pdf or .html file (could be a url) where containing swimming results. Must be formatted in a "normal" fashion - see vignette
node	a CSS node where html results are stored. Required for html results. Default is "pre", which nearly always works.

Value

returns a list of strings containing the information from file. Should then be parsed with swim_parse

See Also

read_results is meant to be followed by swim_parse

Examples

```
## Not run: read_results("http://www.nyhsswim.com/Results/Boys/2008/NYS/Single.htm", node = "pre")
```

read_results_flag *used to indicate that results have been read in with* read_results *prior to being parsed by* swim_parse

Description

Used to insure that read_results has been run on a data source prior to running swim_parse

Usage

```
read_results_flag(x)
```

Arguments

x	a list of results, line by line

Value

returns list x, with "read_results_flag" added as the first element of the list

results_score *Scores a swim meet*

Description

Used to add a Points column with point values for each place. Can either score "timed finals" type meets where any athlete can get any place, or "prelims-finals", type meets, where placing is restricted by prelim performance.

Usage

```
results_score(
  results,
  events,
  meet_type = c("timed_finals", "prelims_finals"),
  lanes = c(4, 6, 8, 10),
  scoring_heats = c(1, 2, 3),
  point_values
)
```

Arguments

results	an output from swim_parse
events	list of events
meet_type	how to score based on timed_finals, where any place is possible, or prelims_finals where athletes are locked into heats for scoring purposes
lanes	number of lanes in to the pool, for purposes of heat
scoring_heats	number of heats which score (if 1 only A final scores, if 2 A and B final score etc.)
point_values	a list of point values for each scoring place

Value

results with point values in a column called Points

Examples

```
## Not run:
file <-
system.file("extdata", "BigTen_WSWIM_2018.pdf", package = "SwimmeR")
BigTenRaw <- read_results(file)

BigTen <- swim_parse(
  BigTenRaw,
  typo = c(
    "^\\s{1,}\\*",
    "^\\s{1,}(\\d{1,2})\\s{2,}",
    ",\\s{1,}University\\s{1,}of",
    "University\\s{1,}of\\s{1,}",
    "\\s{1,}University",
    "SR\\s{2,}",
    "JR\\s{2,}",
    "SO\\s{2,}",
    "FR\\s{2,}"
  ),
  replacement = c(" ",
                  "  \\1 ",
                  "", "", "",
                  "SR ",
                  "JR ",
                  "SO ",
                  "FR "),
  avoid = c("B1G", "Pool")
)

BigTen <- BigTen %>%
  dplyr::filter(
    stringr::str_detect(Event, "Time Trial") == FALSE,
    stringr::str_detect(Event, "Swim-off") == FALSE
  ) %>%
  dplyr::mutate(Team = dplyr::case_when(Team == "Wisconsin, Madi" ~ "Wisconsin",
```

```
                                        TRUE ~ Team))

# begin results_score portion
df <- BigTen %>%
  results_score(
    events = unique(BigTen$Event),
    meet_type = "prelims_finals",
    lanes = 8,
    scoring_heats = 3,
    point_values = c(
     32, 28, 27, 26, 25, 24, 23, 22, 20, 17, 16, 15, 14, 13, 12, 11, 9, 7, 6, 5, 4, 3, 2, 1)
  )

## End(Not run)
```

`sec_format` *Formatting mm:ss.tt times as seconds*

Description

Takes a character string (or list) representing time in swimming format (e.g. 1:35.37) and converts it to a numeric value (95.37) or a list of values representing seconds.

Usage

```
sec_format(x)
```

Arguments

x	A character vector of time(s) in swimming format (e.g. 1:35.93) to be converted to seconds (95.93)

Value

returns the value of the string `x` which represents a time in swimming format (mm:ss.hh) and converts it to seconds

See Also

`sec_format` is the reverse of `mmss_format`

Examples

```
sec_format("1:35.93")
sec_format("16:45.19")
sec_format("25.43")
sec_format(c("1:35.93", "16:45.19", "25.43"))
sec_format(c("1:35.93", "16:45.19", NA, "25.43", ":55.23"))
```

sec_format_helper *Helper function for formatting mm:ss.hh times as seconds, used to enable vectorized operation of* sec_format

Description

Helper function for formatting mm:ss.hh times as seconds, used to enable vectorized operation of sec_format

Usage

```
sec_format_helper(x)
```

Arguments

x	A character vector of time(s) in swimming format (e.g. 1:35.93) to be converted to seconds (95.93)

splash_collect_splits *Collects Splash format splits*

Description

Collects splits and breaks them into a distance and a time, with a corresponding row number

Usage

```
splash_collect_splits(df)
```

Arguments

df	a data frame containing two columns, V1 is row numbers and Dummy as a string combining split distance and split time

Value

a data frame with three columns, V1, Split_Distance and Split

splits_parse — *Collects splits within* swim_parse

Description

Takes the output of read_results and, inside of swim_parse, extracts split times and associated row numbers

Usage

```
splits_parse(text, split_len = split_length)
```

Arguments

text	output of read_results with row numbers appended by add_row_numbers
split_len	length of pool at which splits are measured - usually 25 or 50

Value

returns a data frame with split times and row numbers

See Also

splits_parse runs inside swim_parse on the output of read_results with row numbers from add_row_numbers

splits_parse_ISL — *Collects splits within* swim_parse_ISL

Description

Takes the output of read_results and, inside of swim_parse_ISL, extracts split times and associated row numbers

Usage

```
splits_parse_ISL(text)
```

Arguments

text	output of read_results with tow numbers appended by add_row_numbers

Value

returns a data frame with split times and row numbers

See Also

splits_parse_ISL runs inside swim_parse_ISL on the output of read_results with row numbers from add_row_numbers

---

splits_parse_omega_relays *Collects splits for relays within* swim_parse_omega

---

Description

Takes the output of read_results and, inside of swim_parse_omega, extracts split times and associated row numbers

Usage

```
splits_parse_omega_relays(text, split_len = split_length_omega)
```

Arguments

text	output of read_results with row numbers appended by add_row_numbers
split_len	length of pool at which splits are measured - usually 25 or 50

Value

returns a dataframe with split times and row numbers

See Also

splits_parse runs inside swim_parse_omega on the output of read_results with row numbers from add_row_numbers

---

splits_parse_splash *Collects splits within* swim_parse_splash *for Splash results*

Description

Takes the output of read_results and, inside of swim_parse_splash, extracts split times and associated row numbers

Usage

```
splits_parse_splash(raw_results)
```

Arguments

raw_results	output of read_results with row numbers appended by add_row_numbers

Value

returns a data frame with split times and row numbers

See Also

`splits_parse` runs inside `swim_parse_splash` on the output of `read_results` with row numbers from `add_row_numbers`

`splits_parse_splash_helper_1`

Produces data frames of splits within `swim_parse_splash` *for Splash results*

Description

Converts strings of splits and row numbers into data frames with a row number column (V1) and a splits column (Split_XX)

Usage

```
splits_parse_splash_helper_1(data)
```

Arguments

`data`	a list of lists containing splits and row numbers

Value

returns a data frame with split times and row numbers

See Also

`splits_parse_splash_helper_1` runs inside `splits_parse_splash`

`splits_parse_splash_helper_2`

Produces data frames of splits within `swim_parse_splash` *for Splash results*

Description

Converts strings of splits and row numbers into data frames with a row number column (V1) and a splits column (Split_XX)

Usage

```
splits_parse_splash_helper_2(data, split_distances, i)
```

Arguments

`data`	a list of lists containing splits and row numbers
`split_distances`	a list of distances for splits, e.g. "50m", "100m"
`i`	a number between 1 and the length of `split_distances`

Value

returns a data frame with split times and row numbers

See Also

`splits_parse_splash_helper_2` runs inside `splits_parse_splash`

`splits_parse_splash_relays` *Collects splits for relays within* `swim_parse_splash`

Description

Takes the output of `read_results` and, inside of `swim_parse_splash`, extracts split times and associated row numbers

Usage

```
splits_parse_splash_relays(text, split_len = split_length_splash)
```

Arguments

`text`	output of `read_results` with row numbers appended by `add_row_numbers`
`split_len`	length of pool at which splits are measured - usually 25 or 50

Value

returns a dataframe with split times and row numbers

See Also

`splits_parse` runs inside `swim_parse_splash` on the output of `read_results` with row numbers from `add_row_numbers`

splits_reform *Adds together splits and compares to listed finals time to see if they match.*

Description

Used in testing the workings for `split_parse` inside test-splits.R. Note that even properly handled splits may not match the finals time due to issues in the source material. Sometimes splits aren't fully recorded in the source. Some relays also will not match due to the convention of reporting splits by swimmer (see vignette for more details).

Usage

```
splits_reform(df)
```

Arguments

`df`	a data frame output from `swim_parse` created with `splits = TRUE`

Value

a data frame with a column `not_matching` containing `TRUE` if the splits for that swim match the finals time and `FALSE` if they do not

Author(s)

Greg Pilgrim <gpilgrim2670@gmail.com>

splits_rename_omega *Advances split names by one split_length*

Description

Used to adjust names of splits inside `swim_parse_omega` to account for 50 split not being correctly captured

Usage

```
splits_rename_omega(x, split_len = split_length_omega)
```

Arguments

`x`	a string to rename, from columns output by `splits_parse`
`split_len`	distance for each split

Value

returns string iterated up by split_length

See Also

splits_rename_omega runs inside swim_parse_omega on the output of splits_parse

---

splits_to_cumulative *Converts splits from lap to cumulative format*

Description

Cumulative splits are when each split is the total elapsed time at a given distance. For example, if an athlete swims the first 50 of a 200 yard race in 25.00 seconds (lap and cumulative split), and the second 50 (i.e. the 100 lap split) in 30.00 seconds the cumulative 100 split is 25.00 + 30.00 = 55.00. Some swimming results are reported with lap splits (preferred), but others use cumulative splits. This function converts lap splits to cumulative splits.

Usage

```
splits_to_cumulative(df, threshold = Inf)
```

Arguments

df	a data frame containing results with splits in lap format. Must be formatted in a "normal" SwimmeR fashion - see vignette
threshold	a numeric value above which a split is taken to be cumulative. Default is Inf

Value

a data frame with all splits in lap form

See Also

splits_to_cumulative is the reverse of splits_to_lap

Examples

```
## Not run:
df <- data.frame(Place = rep(1, 2),
                 Name = c("Lenore Lap", "Casey Cumulative"),
                 Team = rep("KVAC", 2),
                 Event = rep("Womens 200 Freestyle", 2),
                 Finals_Time = rep("1:58.00", 2),
                 Split_50 = rep("28.00", 2),
                 Split_100 = c("31.00", "59.00"),
                 Split_150 = c("30.00", "1:29.00"),
                 Split_200 = c("29.00", "1:58.00")
```

```
              )

 # since one entry is in lap time and the other is cumulative, need to
 # set threshold value

 # not setting threshold will produce bad results by attempting to convert
 # Casey Cumulative's splits, which are already in cumulative
 # format, into cumulative format again

 df %>%
   splits_to_cumulative()

 df %>%
   splits_to_cumulative(threshold = 20)

## End(Not run)
```

`splits_to_cumulative_helper_recalc` *Helper function for converting lap splits to cumulative splits*

Description

Helper function for converting lap splits to cumulative splits

Usage

```
splits_to_cumulative_helper_recalc(
  df,
  i,
  split_cols = split_cols,
  threshold = threshold
)
```

Arguments

`df`	a data frame containing splits in lap format
`i`	list of values to iterate along
`split_cols`	list of columns containing splits
`threshold`	a numeric value below which a split is taken to be lap

Value

a list of data frames with all splits in cumulative format for a particular event, each with a single split column converted to cumulative format

splits_to_lap *Converts splits from cumulative to lap format*

Description

Cumulative splits are when each split is the total elapsed time at a given distance. For example, if an athlete swims the first 50 of a 200 yard race in 25.00 seconds (lap and cumulative split), and the second 50 (i.e. the 100 lap split) in 30.00 seconds the cumulative 100 split is 25.00 + 30.00 = 55.00. Some swimming results are reported with lap splits (preferred), but others use cumulative splits. This function converts cumulative splits to lap splits.

Usage

```
splits_to_lap(df, threshold = -Inf)
```

Arguments

df	a data frame containing results with splits in cumulative format. Must be formatted in a "normal" SwimmeR fashion - see vignette
threshold	a numeric value below which a split is taken to be cumulative. Default is -Inf

Value

a data frame with all splits in lap form

See Also

splits_to_lap is the reverse of splits_to_cumulative

Examples

```
## Not run:
df <- data.frame(Place = 1,
                 Name = "Sally Swimfast",
                 Team = "KVAC",
                 Event = "Womens 200 Freestyle",
                 Finals_Time = "1:58.00",
                 Split_50 = "28.00",
                 Split_100 = "59.00",
                 Split_150 = "1:31.00",
                 Split_200 = "1:58.00")

df %>%
 splits_to_lap

df <- data.frame(Place = rep(1, 2),
                 Name = c("Lenore Lap", "Casey Cumulative"),
                 Team = rep("KVAC", 2),
                 Event = rep("Womens 200 Freestyle", 2),
```

```
                 Finals_Time = rep("1:58.00", 2),
                 Split_50 = rep("28.00", 2),
                 Split_100 = c("31.00", "59.00"),
                 Split_150 = c("30.00", "1:29.00"),
                 Split_200 = c("29.00", "1:58.00")
                )

 # since one entry is in lap time and the other is cumulative, need to
 # set threshold value

 # not setting threshold will produce bad results by attempting to convert
 # Lenore Lap's splits, which are already in lap format, into lap format
 # again

 df %>%
   splits_to_lap()

 df %>%
   splits_to_lap(threshold = 35)

## End(Not run)
```

`splits_to_lap_helper_recalc` *Helper function for converting cumulative splits to lap splits*

Description

Helper function for converting cumulative splits to lap splits

Usage

```
splits_to_lap_helper_recalc(
  df,
  i,
  split_cols = split_cols,
  threshold = threshold
)
```

Arguments

`df`	a data frame containing splits in cumulative format
`i`	list of values to iterate along
`split_cols`	list of columns containing splits
`threshold`	a numeric value above which a split is taken to be cumulative

Value

a list of data frames with all splits in lap format for a particular event, each with a single split column converted to lap format

---

`SwimmeR-defunct` *Defunct functions in SwimmeR*

Description

These functions have been made defunct (removed) from `SwimmeR`.

Details

- `course_convert_DF`: This function is defunct, and has been removed from `SwimmeR`. Instead please use `course_convert(verbose = TRUE)`

`SwimmeR-deprecated` *Deprecated functions in SwimmeR*

Description

These functions still work but will be removed (defunct) in upcoming versions.

`Swim_Parse` *Formats swimming and diving data read with* `read_results` *into a data frame*

Description

Takes the output of `read_results` and cleans it, yielding a data frame of swimming (and diving) results

Usage

```
Swim_Parse(
  file,
  avoid = NULL,
  typo = typo_default,
  replacement = replacement_default,
  format_results = TRUE,
  splits = FALSE,
  split_length = 50,
  relay_swimmers = FALSE
```

```
)

swim_parse(
  file,
  avoid = NULL,
  typo = typo_default,
  replacement = replacement_default,
  format_results = TRUE,
  splits = FALSE,
  split_length = 50,
  relay_swimmers = FALSE
)
```

Arguments

file	output from read_results
avoid	a list of strings. Rows in file containing these strings will not be included. For example "Pool:", often used to label pool records, could be passed to avoid. The default is avoid_default, which contains many strings similar to "Pool:", such as "STATE:" and "Qual:". Users can supply their own lists to avoid. avoid is handled before typo and replacement.
typo	a list of strings that are typos in the original results. swim_parse is particularly sensitive to accidental double spaces, so "Central High School", with two spaces between "Central" and "High" is a problem, which can be fixed. Pass "Central High School" to typo. Unexpected commas as also an issue, for example "Texas, University of" should be fixed using typo and replacement
replacement	a list of fixes for the strings in typo. Here one could pass "Central High School" (one space between "Central" and "High") and "Texas" to replacement fix the issues described in typo
format_results	should the results be formatted for analysis (special strings like "DQ" replaced with NA, Finals_Time as definitive column)? Default is TRUE
splits	either TRUE or the default, FALSE - should swim_parse attempt to include splits.
split_length	either 25 or the default, 50, the length of pool at which splits are recorded. Not all results are internally consistent on this issue - some have races with splits by 50 and other races with splits by 25.
relay_swimmers	either TRUE or the default, FALSE - should relay swimmers be reported. Relay swimmers are reported in separate columns named Relay_Swimmer_1 etc.

Value

returns a data frame with columns Name, Place, Age, Team, Prelims_Time, Finals_Time, Points, Event & DQ. Note all swims will have a Finals_Time, even if that time was actually swam in the prelims (i.e. a swimmer did not qualify for finals). This is so that final results for an event can be generated from just one column.

See Also

swim_parse must be run on the output of read_results

Examples

```
## Not run:
swim_parse(read_results("http://www.nyhsswim.com/Results/Boys/2008/NYS/Single.htm", node = "pre"),
 typo = c("-1NORTH ROCKL"), replacement = c("1-NORTH ROCKL"),
 splits = TRUE,
 relay_swimmers = TRUE)

## End(Not run)
## Not run:
swim_parse(read_results("inst/extdata/Texas-Florida-Indiana.pdf"),
 typo = c("Indiana  University", ", University of"), replacement = c("Indiana University", ""),
 splits = TRUE,
 relay_swimmers = TRUE)

## End(Not run)
```

`swim_parse_hytek` *Formats Hytek style swimming and diving data read with* `read_results` *into a data frame*

Description

Takes the output of `read_results` and cleans it, yielding a data frame of swimming (and diving) results

Usage

```
swim_parse_hytek(
  file_hytek,
  avoid_hytek = avoid,
  typo_hytek = typo,
  replacement_hytek = replacement,
  format_results = TRUE,
  splits = FALSE,
  split_length_hytek = split_length,
  relay_swimmers_hytek = relay_swimmers
)
```

Arguments

`file_hytek`	output from `read_results`
`avoid_hytek`	a list of strings. Rows in `file_hytek` containing these strings will not be included. For example "Pool:", often used to label pool records, could be passed to `avoid_hytek`. The default is `avoid_default`, which contains many strings similar to "Pool:", such as "STATE:" and "Qual:". Users can supply their own lists to `avoid_hytek`. `avoid_hytek` is handled before `typo_hytek` and `replacement_hytek`.

typo_hytek
: a list of strings that are typos in the original results. swim_parse is particularly sensitive to accidental double spaces, so "Central High School", with two spaces between "Central" and "High" is a problem, which can be fixed. Pass "Central High School" to typo_hytek. Unexpected commas as also an issue, for example "Texas, University of" should be fixed using typo_hytek and replacement_hytek

replacement_hytek
: a list of fixes for the strings in typo_hytek. Here one could pass "Central High School" (one space between "Central" and "High") and "Texas" to replacement_hytek fix the issues described in typo_hytek

format_results
: should the results be formatted for analysis (special strings like "DQ" replaced with NA, Finals_Time as definitive column)? Default is TRUE

splits
: either TRUE or the default, FALSE - should swim_parse attempt to include splits.

split_length_hytek
: either 25 or the default, 50, the length of pool at which splits are recorded. Not all results are internally consistent on this issue - some have races with splits by 50 and other races with splits by 25.

relay_swimmers_hytek
: should names of relay swimmers be captured? Default is FALSE

Value

returns a data frame with columns Name, Place, Age, Team, Prelims_Time, Finals_Time, Points, Event & DQ. Note all swims will have a Finals_Time, even if that time was actually swam in the prelims (i.e. a swimmer did not qualify for finals). This is so that final results for an event can be generated from just one column.

See Also

swim_parse_hytek must be run on the output of read_results

---

swim_parse_ISL *Formats swimming results from the International Swim League ('ISL') read with* read_results *into a data frame*

Description

Takes the output of read_results and cleans it, yielding a data frame of 'ISL' swimming results

Usage

```
swim_parse_ISL(file, splits = FALSE, relay_swimmers = FALSE)

Swim_Parse_ISL(file, splits = FALSE, relay_swimmers = FALSE)
```

Arguments

file	output from read_results
splits	should splits be included, default is FALSE
relay_swimmers	should relay swimmers be included as separate columns, default is FALSE

Value

returns a data frame of ISL results

Author(s)

Greg Pilgrim <gpilgrim2670@gmail.com>

See Also

swim_parse_ISL must be run on the output of read_results

Examples

```
## Not run:
swim_parse_ISL(
read_results(
"https://isl.global/wp-content/uploads/2019/11/isl_college_park_results_day_2.pdf"),
splits = TRUE,

swim_parse_old *Formats swimming and diving data read with* read_results *into a data frame*

Description

Takes the output of read_results and cleans it, yielding a data frame of swimming (and diving) results. Old version, retired in dev build on Dec 21, 2020 and release version 0.7.0

Usage

```
swim_parse_old(
  file,
  avoid = avoid_default,
  typo = typo_default,
  replacement = replacement_default,
  splits = FALSE,
  split_length = 50,
  relay_swimmers = FALSE
)
```

Arguments

file	output from read_results
avoid	a list of strings. Rows in file containing these strings will not be included. For example "Pool:", often used to label pool records, could be passed to avoid. The default is avoid_default, which contains many strings similar to "Pool:", such as "STATE:" and "Qual:". Users can supply their own lists to avoid.
typo	a list of strings that are typos in the original results. swim_parse_old is particularly sensitive to accidental double spaces, so "Central High School", with two spaces between "Central" and "High" is a problem, which can be fixed. Pass "Central High School" to typo. Unexpected commas as also an issue, for example "Texas, University of" should be fixed using typo and replacement
replacement	a list of fixes for the strings in typo. Here one could pass "Central High School" (one space between "Central" and "High") and "Texas" to replacement fix the issues described in typo
splits	either TRUE or the default, FALSE - should swim_parse_old attempt to include splits.
split_length	either 25 or the default, 50, the length of pool at which splits are recorded. Not all results are internally consistent on this issue - some have races with splits by 50 and other races with splits by 25.
relay_swimmers	either TRUE or the default, FALSE - should relay swimmers be reported. Relay swimmers are reported in separate columns named Relay_Swimmer_1 etc.

Value

returns a data frame with columns Name, Place, Age, Team, Prelims_Time, Finals_Time, Points, Event & DQ. Note all swims will have a Finals_Time, even if that time was actually swam in the prelims (i.e. a swimmer did not qualify for finals). This is so that final results for an event can be generated from just one column.

See Also

swim_parse_old must be run on the output of read_results

Examples

```
## Not run:
swim_parse_old(
 read_results("http://www.nyhsswim.com/Results/Boys/2008/NYS/Single.htm", node = "pre"),
  typo = c("-1NORTH ROCKL"), replacement = c("1-NORTH ROCKL"),
  splits = TRUE,
  relay_swimmers = TRUE)

## End(Not run)
## Not run:
swim_parse_old(read_results("inst/extdata/Texas-Florida-Indiana.pdf"),
 typo = c("Indiana  University", ", University of"), replacement = c("Indiana University", ""),
 splits = TRUE,
 relay_swimmers = TRUE)
```

```
## End(Not run)
```

`swim_parse_omega` *Formats Omega style swimming and diving data read with* `read_results` *into a data frame*

Description

Takes the output of `read_results` and cleans it, yielding a data frame of swimming (and diving) results

Usage

```
swim_parse_omega(
  file_omega,
  avoid_omega = avoid,
  typo_omega = typo,
  replacement_omega = replacement,
  format_results = TRUE,
  splits = FALSE,
  split_length_omega = split_length,
  relay_swimmers_omega = relay_swimmers
)
```

Arguments

`file_omega`	output from `read_results`
`avoid_omega`	a list of strings. Rows in `file_omega` containing these strings will not be included. For example "Pool:", often used to label pool records, could be passed to `avoid_omega`. The default is `avoid_default`, which contains many strings similar to "Pool:", such as "STATE:" and "Qual:". Users can supply their own lists to `avoid_omega`. `avoid_omega` is handled before `typo_omega` and `replacement_omega`.
`typo_omega`	a list of strings that are typos in the original results. `swim_parse` is particularly sensitive to accidental double spaces, so "Central High School", with two spaces between "Central" and "High" is a problem, which can be fixed. Pass "Central High School" to `typo_omega`. Unexpected commas as also an issue, for example "Texas, University of" should be fixed using `typo_omega` and `replacement_omega`
`replacement_omega`	a list of fixes for the strings in `typo_omega`. Here one could pass "Central High School" (one space between "Central" and "High") and "Texas" to `replacement_omega` fix the issues described in `typo_omega`
`format_results`	should the results be formatted for analysis (special strings like `"DQ"` replaced with `NA`, `Finals_Time` as definitive column)? Default is `TRUE`
`splits`	either `TRUE` or the default, `FALSE` - should `swim_parse` attempt to include splits.

split_length_omega
: either 25 or the default, 50, the length of pool at which splits are recorded. Not all results are internally consistent on this issue - some have races with splits by 50 and other races with splits by 25.

relay_swimmers_omega
: should names of relay swimmers be captured? Default is FALSE

Value

returns a data frame with columns Name, Place, Age, Team, Prelims_Time, Finals_Time, Points, Event & DQ. Note all swims will have a Finals_Time, even if that time was actually swam in the prelims (i.e. a swimmer did not qualify for finals). This is so that final results for an event can be generated from just one column.

swim_parse_samms *Formats swimming and diving data read with* read_results *into a dataframe*

Description

Takes the output of read_results of S.A.M.M.S. results and cleans it, yielding a dataframe of swimming (and diving) results

Usage

```
swim_parse_samms(
  file_samms,
  avoid_samms = avoid,
  typo_samms = typo,
  replacement_samms = replacement,
  format_samms = format_results
)
```

Arguments

file_samms	output from read_results of S.A.M.M.S. style results
avoid_samms	a list of strings. Rows in file containing these strings will not be included. For example "Pool:", often used to label pool records, could be passed to avoid. The default is avoid_default, which contains many strings similar to "Pool:", such as "STATE:" and "Qual:". Users can supply their own lists to avoid.

typo_samms
: a list of strings that are typos in the original results. swim_parse is particularly sensitive to accidental double spaces, so "Central High School", with two spaces between "Central" and "High" is a problem, which can be fixed. Pass "Central High School" to typo. Unexpected commas as also an issue, for example "Texas, University of" should be fixed using typo and replacement

replacement_samms
: a list of fixes for the strings in typo. Here one could pass "Central High School" (one space between "Central" and "High") and "Texas" to replacement fix the issues described in typo

format_samms
: should the data be formatted for analysis (special strings like "DQ" replaced with NA, Finals_Time as definitive column)? Default is TRUE

Value

returns a data frame with columns Name, Place, Age, Team, Prelims_Time, Finals_Time, Event & DQ. Note all swims will have a Finals_Time, even if that time was actually swam in the prelims (i.e. a swimmer did not qualify for finals). This is so that final results for an event can be generated from just one column.

swim_parse_splash *Formats Splash style swimming and diving data read with* read_results *into a data frame*

Description

Takes the output of read_results and cleans it, yielding a data frame of swimming (and diving) results

Usage

```
swim_parse_splash(
  file_splash,
  avoid_splash = avoid,
  typo_splash = typo,
  replacement_splash = replacement,
  format_results = TRUE,
  splits = FALSE,
  split_length_splash = split_length,
  relay_swimmers_splash = relay_swimmers
)
```

Arguments

file_splash	output from read_results
avoid_splash	a list of strings. Rows in file_splash containing these strings will not be included. For example "Pool:", often used to label pool records, could be passed to avoid_splash. The default is avoid_default, which contains many strings similar to "Pool:", such as "STATE:" and "Qual:". Users can supply their own lists to avoid_splash. avoid_splash is handled before typo_splash and replacement_splash.
typo_splash	a list of strings that are typos in the original results. swim_parse is particularly sensitive to accidental double spaces, so "Central High School", with two spaces between "Central" and "High" is a problem, which can be fixed. Pass "Central High School" to typo_splash. Unexpected commas as also an issue, for example "Texas, University of" should be fixed using typo_splash and replacement_splash
replacement_splash	a list of fixes for the strings in typo_splash. Here one could pass "Central High School" (one space between "Central" and "High") and "Texas" to replacement_splash fix the issues described in typo_splash
format_results	should the results be formatted for analysis (special strings like "DQ" replaced with NA, Finals_Time as definitive column)? Default is TRUE
splits	either TRUE or the default, FALSE - should swim_parse attempt to include splits.
split_length_splash	either 25 or the default, 50, the length of pool at which splits are recorded. Not all results are internally consistent on this issue - some have races with splits by 50 and other races with splits by 25.
relay_swimmers_splash	should names of relay swimmers be captured? Default is FALSE

Value

returns a data frame with columns Name, Place, Age, Team, Prelims_Time, Finals_Time, Points, Event & DQ. Note all swims will have a Finals_Time, even if that time was actually swam in the prelims (i.e. a swimmer did not qualify for finals). This is so that final results for an event can be generated from just one column.

swim_parse_splash must be run on the output of read_results

---

swim_place *Adds places to swimming results*

Description

Places are awarded on the basis of time, with fastest (lowest) time winning. Ties are placed as ties (both athletes get 2nd etc.)

Usage

```
swim_place(df, max_place)
```

Arguments

df	a data frame with results from swim_parse, including only swimming results (not diving)
max_place	highest place value that scores

Value

a data frame modified so that places have been appended based on swimming time

See Also

swim_place is a helper function used inside of results_score

---

tie_rescore *Rescore to account for ties*

Description

Rescoring to average point values for ties. Ties are placed as ties (both athletes get 2nd etc.)

Usage

```
tie_rescore(df, point_values, lanes)
```

Arguments

df	a data frame with results from swim_parse, with places from swim_place and/or dive_place
point_values	a named list of point values for each scoring place
lanes	number of scoring lanes in the pool

Value

df modified so that places have been appended based on swimming time

See Also

tie_rescore is a helper function used inside of results_score

undo_interleave *Undoes interleaving of lists*

Description

If two lists have been interleaved this function will return the lists separated and then concatenated

Usage

```
undo_interleave(x)
```

Arguments

x	a list to be un-interleaved

Value

a list comprising the interleaved components of x joined into one list

Examples

```
l <- c("A", "D", "B", "E", "C", "F")
undo_interleave(l)
```

%notin% *"Not in" function*

Description

The opposite of ‘ ‘FALSE‘ otherwise.

Usage

```
x %notin% y

x %!in% y
```

Arguments

x	a value
y	a list of values

Value

a ‘TRUE‘ or ‘FALSE‘

Examples

```
"a" %!in% c("a", "b", "c")
"a" %notin% c("b", "c")
```
