

Package ‘aroma.affymetrix’

October 12, 2022

Version 3.2.1

Depends R (>= 3.2.0), R.utils (>= 2.9.0), aroma.core (>= 3.2.0)

Imports methods, R.methodsS3 (>= 1.7.1), R.oo (>= 1.23.0), R.cache (>= 0.14.0), R.devices (>= 2.16.1), R.filesets (>= 2.13.0), aroma.apd (>= 0.6.0), MASS, splines, matrixStats (>= 0.55.0), listenv, future

Suggests DBI (>= 1.0.0), gsmoothr (>= 0.1.7), RColorBrewer (>= 1.1-2), Biobase (>= 2.28.0), BiocGenerics (>= 0.14.0), affxparser (>= 1.40.0), affy (>= 1.46.0), affyPLM (>= 1.44.0), aroma.light (>= 2.4.0), gcrma (>= 2.40.0), limma (>= 3.24.1), oligo (>= 1.32.0), oligoClasses (>= 1.30.0), pdInfoBuilder (>= 1.32.0), preprocessCore (>= 1.28.0), AffymetrixDataTestFiles, dChipIO (>= 0.1.1)

SuggestsNote BioC (>= 3.0), Recommended: preprocessCore, affyPLM, aroma.light, affxparser, DNACopy

Title Analysis of Large Affymetrix Microarray Data Sets

Description A cross-platform R framework that facilitates processing of any number of Affymetrix microarray samples regardless of computer system. The only parameter that limits the number of chips that can be processed is the amount of available disk space. The Aroma Framework has successfully been used in studies to process tens of thousands of arrays. This package has actively been used since 2006.

aroma.affymetrix-package

Package aroma.affymetrix

Description

A cross-platform R framework that facilitates processing of any number of Affymetrix microarray samples regardless of computer system. The only parameter that limits the number of chips that can be processed is the amount of available disk space. The Aroma Framework has successfully been used in studies to process tens of thousands of arrays. This package has actively been used since 2006.

Installation and updates

The preferred way to install this package is:

```
source("https://callr.org/install#aroma.affymetrix")
```

To get started

To get started, see the online user guides and the vignettes <https://www.aroma-project.org/>.

How to cite this package

In order to keep improving and providing support for this project, please cite references [1], [2], or any applicable publication listed on <https://aroma-project.org/publications/>, whenever you publish work that have been used any of the Aroma Framework.

License

The releases of this package is licensed under LGPL version 2.1 or newer.

The development code of the packages is under a private license (where applicable) and patches sent to the author fall under the latter license, but will be, if incorporated, released under the "release" license above.

 AbstractProbeSequenceNormalization

The AbstractProbeSequenceNormalization class

Description

Package: aroma.affymetrix

Class AbstractProbeSequenceNormalization

Object

```

~|
~+--ParametersInterface
~~~~~|
~~~~~+--AromaTransform
~~~~~|
~~~~~+--Transform
~~~~~|
~~~~~+--ProbeLevelTransform
~~~~~|
~~~~~+--ProbeLevelTransform3
~~~~~|
~~~~~+--AbstractProbeSequenceNormalization
  
```

Directly known subclasses:

[BaseCountNormalization](#), [BasePositionNormalization](#), [LinearModelProbeSequenceNormalization](#), [MatNormalization](#)

```

public abstract static class AbstractProbeSequenceNormalization
  extends ProbeLevelTransform3
  
```

This abstract class represents a normalization method that corrects for systematic effects in the probe intensities due to differences in probe sequences.

Usage

```

AbstractProbeSequenceNormalization(..., target=NULL)
  
```

Arguments

...	Arguments passed to the constructor of ProbeLevelTransform3 .
target	A character string specifying type of "target" used. If "zero", all arrays are normalized to have no effects. If NULL , all arrays a normalized to have the same effect as the average array has.

Fields and Methods**Methods:**

```

getTargetFile -
process -

```

Methods inherited from ProbeLevelTransform3:

getAsteriskTags, getCellsTo, getCellsToFit, getCellsToUpdate, getParameters, getUnitsTo, getUnitsToFit, getUnitsToUpdate, writeSignals

Methods inherited from ProbeLevelTransform:

getRootPath

Methods inherited from Transform:

getOutputDataSet, getOutputFiles

Methods inherited from AromaTransform:

as.character, findFilesTodo, getAsteriskTags, getExpectedOutputFiles, getExpectedOutputFullnames, getFullName, getInputDataSet, getName, getOutputDataSet, getOutputDataSet0, getOutputFiles, getPath, getRootPath, getTags, isDone, process, setTags

Methods inherited from ParametersInterface:

getParameterSets, getParameters, getParametersAsString

Methods inherited from Object:

\$, \$<-, [], [[<-, as.character, attach, attachLocally, clearCache, clearLookupCache, clone, detach, equals, extend, finalize, getEnvironment, getFieldModifier, getFieldModifiers, getFields, getInstantiationTime, getStaticInstance, hasField, hashCode, ll, load, names, objectSize, print, save, asThis

Requirements

This class requires that an [AromaCellSequenceFile](#) is available for the chip type.

Author(s)

Henrik Bengtsson

AdditiveCovariatesNormalization

The AdditiveCovariatesNormalization class

Description

Package: aroma.affymetrix

Class AdditiveCovariatesNormalization

[Object](#)

~~|

```

~+---ParametersInterface
~~~~~|
~~~~~+---AromaTransform
~~~~~|
~~~~~+---Transform
~~~~~|
~~~~~+---ChipEffectTransform
~~~~~|
~~~~~+---AdditiveCovariatesNormalization

```

Directly known subclasses:

[GcContentNormalization2](#)

```

public abstract static class AdditiveCovariatesNormalization
extends ChipEffectTransform

```

This class represents a normalization method that corrects for GC-content effects on copy-number chip-effect estimates.

Usage

```

AdditiveCovariatesNormalization(dataSet=NULL, ..., target=NULL, subsetToFit="-XY",
  shift=0, onMissing=c("median", "ignore"))

```

Arguments

dataSet	A SnpChipEffectSet .
...	Additional arguments passed to the constructor of ChipEffectTransform .
target	(Optional) A character string or a function specifying what to normalize toward.
subsetToFit	The units from which the normalization curve should be estimated. If NULL , all are considered.
onMissing	Specifies how to normalize units for which the GC contents are unknown.
shift	An optional amount the data points should be shifted (translated).

Details

For SNPs, the normalization function is estimated based on the total chip effects, i.e. the sum of the allele signals. The normalizing is done by rescale the chip effects on the intensity scale such that the mean of the total chip effects are the same across samples for any given GC content. For allele-specific estimates, both alleles are always rescaled by the same amount. Thus, when normalizing allele-specific chip effects, the total chip effects is change, but not the relative allele signal, e.g. the allele B frequency.

Fields and Methods

Methods:

```

getCdf    -
process   -

```

Methods inherited from ChipEffectTransform:

getRootPath

Methods inherited from Transform:

getOutputDataSet, getOutputFiles

Methods inherited from AromaTransform:

as.character, findFilesTodo, getAsteriskTags, getExpectedOutputFiles, getExpectedOutputFullnames, getFullName, getInputDataSet, getName, getOutputDataSet, getOutputDataSet0, getOutputFiles, getPath, getRootPath, getTags, isDone, process, setTags

Methods inherited from ParametersInterface:

getParameterSets, getParameters, getParametersAsString

Methods inherited from Object:

\$. \$<-, [], [[<-, as.character, attach, attachLocally, clearCache, clearLookupCache, clone, detach, equals, extend, finalize, getEnvironment, getFieldModifier, getFieldModifiers, getFields, getInstantiationTime, getStaticInstance, hasField, hashCode, ll, load, names, objectSize, print, save, asThis

AffineCnPlm

The AffineCnPlm class

Description

Package: aroma.affymetrix

Class AffineCnPlm

Object

```

~~|
~~+--ParametersInterface
~~~~~|
~~~~~+--Model
~~~~~|
~~~~~+--UnitModel
~~~~~|
~~~~~+--MultiArrayUnitModel
~~~~~|
~~~~~+--ProbeLevelModel
~~~~~|
~~~~~+--AffinePlm
~~~~~|

```

Directly known subclasses:

```
public abstract static class AffineCnPlm
extends CnPlm
```

Usage

```
AffineCnPlm(..., combineAlleles=FALSE)
```

Arguments

```
...           Arguments passed to AffineSnpPlm.
combineAlleles  If FALSE, allele A and allele B are treated separately, otherwise together.
```

Fields and Methods

Methods:

No methods defined.

Methods inherited from [CnPlm](#):

[getCellIndices](#), [getChipEffectSet](#), [getCombineAlleles](#), [getParameters](#), [getProbeAffinityFile](#), [setCombineAlleles](#)

Methods inherited from [SnpPlm](#):

[getCellIndices](#), [getChipEffectSet](#), [getMergeStrands](#), [getParameters](#), [getProbeAffinityFile](#), [setMergeStrands](#)

Methods inherited from [AffineSnpPlm](#):

[getAsteriskTags](#)

Methods inherited from [AffinePlm](#):

[getAsteriskTags](#), [getFitUnitGroupFunction](#), [getProbeAffinityFile](#)

Methods inherited from [ProbeLevelModel](#):

[calculateResidualSet](#), [calculateWeights](#), [fit](#), [getAsteriskTags](#), [getCalculateResidualsFunction](#), [getChipEffectSet](#), [getProbeAffinityFile](#), [getResidualSet](#), [getRootPath](#), [getWeightsSet](#)

Methods inherited from [MultiArrayUnitModel](#):

[getListOfPriors](#), [setListOfPriors](#), [validate](#)

Methods inherited from [UnitModel](#):

[findUnitsTodo](#), [getAsteriskTags](#), [getFitSingleCellUnitFunction](#), [getParameters](#)

Methods inherited from Model:

as.character, fit, getAlias, getAsteriskTags, getDataSet, getFullName, getName, getPath, getRootPath, getTags, setAlias, setTags

Methods inherited from ParametersInterface:

getParameterSets, getParameters, getParametersAsString

Methods inherited from Object:

\$, \$<-, [], [[<-, as.character, attach, attachLocally, clearCache, clearLookupCache, clone, detach, equals, extend, finalize, getEnvironment, getFieldModifier, getFieldModifiers, getFields, getInstantiationTime, getStaticInstance, hasField, hashCode, ll, load, names, objectSize, print, save, asThis

AffinePlm

The AffinePlm class

Description

Package: aroma.affymetrix

Class AffinePlm**Object**

```

~~|
~~+--ParametersInterface
~~~~~|
~~~~~+--Model
~~~~~|
~~~~~+--UnitModel
~~~~~|
~~~~~+--MultiArrayUnitModel
~~~~~|
~~~~~+--ProbeLevelModel
~~~~~|
~~~~~+--AffinePlm

```

Directly known subclasses:

AffineCnPlm, AffineSnpPlm

```

public abstract static class AffinePlm
extends ProbeLevelModel

```

This class represents affine model in Bengtsson & Hossjer (2006).

Usage

```
AffinePlm(..., background=TRUE)
```

Arguments

... Arguments passed to [ProbeLevelModel](#).

background If `TRUE`, background is estimate for each unit group, otherwise not. That is, if `FALSE`, a *linear* (proportional) model without offset is fitted, resulting in very similar results as obtained by the [MbeiPlm](#).

Fields and Methods**Methods:**

```
getProbeAffinityFile -
```

Methods inherited from ProbeLevelModel:

calculateResidualSet, calculateWeights, fit, getAsteriskTags, getCalculateResidualsFunction, getChipEffectSet, getProbeAffinityFile, getResidualSet, getRootPath, getWeightsSet

Methods inherited from MultiArrayUnitModel:

getListOfPriors, setListOfPriors, validate

Methods inherited from UnitModel:

findUnitsTodo, getAsteriskTags, getFitSingleCellUnitFunction, getParameters

Methods inherited from Model:

as.character, fit, getAlias, getAsteriskTags, getDataSet, getFullName, getName, getPath, getRootPath, getTags, setAlias, setTags

Methods inherited from ParametersInterface:

getParameterSets, getParameters, getParametersAsString

Methods inherited from Object:

\$. \$<-, [[, [[<-, as.character, attach, attachLocally, clearCache, clearLookupCache, clone, detach, equals, extend, finalize, getEnvironment, getFieldModifier, getFieldModifiers, getFields, getInstantiationTime, getStaticInstance, hasField, hashCode, ll, load, names, objectSize, print, save, asThis

Model

For a single unit group, the affine model is:

$$y_{ik} = a + \theta_i \phi_k + \varepsilon_{ik}$$

where a is an offset common to all probe signals, θ_i are the chip effects for arrays $i = 1, \dots, I$, and ϕ_k are the probe affinities for probes $k = 1, \dots, K$. The ε_{ik} are zero-mean noise with equal variance. The model is constrained such that $\prod_k \phi_k = 1$.

Note that with the additional constraint $a = 0$ (see arguments above), the above model is very similar to [MbeiPlm](#). The differences in parameter estimates is due to difference in assumptions about the error structure, which in turn affects how the model is estimated.

Author(s)

Henrik Bengtsson

~~~~~|
~~~~~+--AffineSnpPlm

```

Directly known subclasses:*AffineCnPlm*public abstract static class **AffineSnpPlm**extends [SnpPlm](#)**Usage**

AffineSnpPlm(..., mergeStrands=FALSE)

Arguments

...	Arguments passed to AffinePlm .
mergeStrands	If <code>TRUE</code> , the sense and the anti-sense strands are fitted together, otherwise separately.

Fields and Methods**Methods:**

No methods defined.

Methods inherited from SnpPlm:

getCellIndices, getChipEffectSet, getMergeStrands, getParameters, getProbeAffinityFile, setMergeStrands

Methods inherited from AffinePlm:

getAsteriskTags, getFitUnitGroupFunction, getProbeAffinityFile

Methods inherited from ProbeLevelModel:

calculateResidualSet, calculateWeights, fit, getAsteriskTags, getCalculateResidualsFunction, getChipEffectSet, getProbeAffinityFile, getResidualSet, getRootPath, getWeightsSet

Methods inherited from MultiArrayUnitModel:

getListOfPriors, setListOfPriors, validate

Methods inherited from UnitModel:

~~~~~+---AromaPlatformInterface
~~~~~|
~~~~~+---AffymetrixFile
~~~~~|
~~~~~+---AffymetrixCelFile

```

Directly known subclasses:

ChipEffectFile, CnChipEffectFile, CnProbeAffinityFile, ExonChipEffectFile, ExonProbeAffinityFile, FirmaFile, ParameterCelFile, ProbeAffinityFile, QualityAssessmentFile, ResidualFile, SnpChipEffectFile, SnpProbeAffinityFile, WeightsFile

```

public abstract static class AffymetrixCelFile
extends AffymetrixFile

```

An AffymetrixCelFile object represents a single Affymetrix CEL file.

Usage

```
AffymetrixCelFile(..., cdf=NULL)
```

Arguments

...	Arguments passed to AromaMicroarrayDataFile .
cdf	An optional AffymetrixCdfFile making it possible to override the default CDF file as specified by the CEL file header. The requirement is that its number of cells must match that of the CEL file. If <code>NULL</code> , the CDF structure is inferred from the the chip type as specified in the CEL file header.

Fields and Methods**Methods:**

extractMatrix	-
getAm	-
getCdf	-
getFileFormat	-
getImage	-
getUnitNamesFile	-
getUnitTypesFile	-
image270	-
nbrOfCells	-
plotDensity	-
plotImage	-

```

plotMvsA      -
plotMvsX      -
setCdf        -
smoothScatterMvsA -
writeImage    -

```

Methods inherited from AromaPlatformInterface:

getAromaPlatform, getAromaUffFile, getAromaUgpFile, getChipType, getPlatform, getUnitAnnotationDataFile, getUnitNamesFile, getUnitTypesFile, isCompatibleWith

Methods inherited from AromaMicroarrayDataFile:

getAttributeXY, getChipType, getPlatform, getPloidy, getXAM, hasAttributeXY, isAverageFile, setAttributeXY, setAttributesByTags

Methods inherited from FileCacheKeyInterface:

getCacheKey

Methods inherited from CacheKeyInterface:

getCacheKey

Methods inherited from GenericDataFile:

as.character, clone, compareChecksum, copyTo, equals, fromFile, getAttribute, getAttributes, getChecksum, getChecksumFile, getCreatedOn, getDefaultFullName, getExtension, getExtensionPattern, getFileSize, getFileType, getFilename, getFilenameExtension, getLastAccessedOn, getLastModifiedOn, getOutputExtension, getPath, getPathname, gunzip, gzip, hasBeenModified, is.na, isFile, isGzipped, linkTo, readChecksum, renameTo, renameToUpperCaseExt, setAttribute, setAttributes, setAttributesBy, setAttributesByTags, setExtensionPattern, testAttributes, validate, validateChecksum, writeChecksum, getParentName

Methods inherited from FullNameInterface:

appendFullNameTranslator, appendFullNameTranslatorByNULL, appendFullNameTranslatorByTabularTextFile, appendFullNameTranslatorByTabularTextFileSet, appendFullNameTranslatorBycharacter, appendFullNameTranslatorBydata.frame, appendFullNameTranslatorByfunction, appendFullNameTranslatorBylist, clearFullNameTranslator, clearListOfFullNameTranslators, getDefaultFullName, getFullName, getFullNameTranslator, getListOfFullNameTranslators, getName, getTags, hasTag, hasTags, resetFullName, setFullName, setFullNameTranslator, setListOfFullNameTranslators, setName, setTags, updateFullName

Methods inherited from Object:

\$, \$<-, [, [(<-, as.character, attach, attachLocally, clearCache, clearLookupCache, clone, detach, equals, extend, finalize, getEnvironment, getFieldModifier, getFieldModifiers, getFields, getInstantiationTime, getStaticInstance, hasField, hashCode, ll, load, names, objectSize, print, save, asThis

For developers

If you subclass this class, please make sure to query the [AffymetrixCdfFile](#) object (see `*getCdf()`) whenever querying CDF information. Do not use the CDF file inferred from the chip type in CEL header, unless you really want it to be hardwired that way, otherwise you will break to possibility to override the CDF structure.

AlleleSummation      *The AlleleSummation class*

---

**Description**

Package: aroma.affymetrix

**Class AlleleSummation**

Object

```

~~|
~~+--ParametersInterface
~~~~~|
~~~~~+--Model
~~~~~|
~~~~~+--UnitModel
~~~~~|
~~~~~+--AlleleSummation

```

**Directly known subclasses:**

```

public abstract static class AlleleSummation
extends UnitModel

```

This class takes allele-specific chip effect estimates of a SnpChipEffectSet and returns a CnChipEffectSet holding the summed allele estimates.

**Usage**

```
AlleleSummation(dataSet=NULL, ignoreNAs=TRUE, ...)
```

**Arguments**

```

dataSet A SnpChipEffectSet.
ignoreNAs If TRUE, missing values are excluded when summing the signals from the two alleles.
... Arguments passed to UnitModel.

```

**Fields and Methods****Methods:**

```

findUnitsTodo -
getChipEffectSet -
process -

```

**Methods inherited from UnitModel:**

findUnitsTodo, getAsteriskTags, getFitSingleCellUnitFunction, getParameters

**Methods inherited from Model:**

AllelicCrosstalkCalibration

*The AllelicCrosstalkCalibration class*

---

**Description**

Package: aroma.affymetrix

**Class AllelicCrosstalkCalibration****Object**

```

~~|

```

```

~~+--ParametersInterface

```

```

~~~~~|

```

```

~~~~~+--AromaTransform

```

```

~~~~~|

```

```

~~~~~+--Transform

```

```

~~~~~|

```

```

~~~~~+--ProbeLevelTransform

```

```

~~~~~|

```

```

~~~~~+--AllelicCrosstalkCalibration

```

**Directly known subclasses:**

```
public static class AllelicCrosstalkCalibration
extends ProbeLevelTransform
```

This class represents a calibration function that transforms the probe-level signals such that the signals from the two alleles are orthogonal. The method fits and calibrates PM signals only. MM signals will not affect the model fitting and are unaffected.

### Usage

```
AllelicCrosstalkCalibration(dataSet=NULL, ..., model=c("asis", "auto", "CRMA", "CRMAv2"),
 rescaleBy=c("auto", "groups", "all", "none"), targetAvg=c(2200, 2200),
 subsetToAvg="-XY", mergeShifts=TRUE, B=1, flavor=c("sfit", "expectile"),
 alpha=c(0.1, 0.075, 0.05, 0.03, 0.01), q=2, Q=98, lambda=2,
 pairBy=c("CDF", "sequence"))
```

### Arguments

|                     |                                                                                                                                                                                                      |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dataSet             | An <a href="#">AffymetrixCelSet</a> .                                                                                                                                                                |
| ...                 | Arguments passed to the constructor of <a href="#">ProbeLevelTransform</a> .                                                                                                                         |
| model               | A <a href="#">character</a> string for quickly specifying default parameter settings.                                                                                                                |
| rescaleBy           | A <a href="#">character</a> string specifying what sets of cells should be rescaled towards a target average, if any. Default is to rescale all cells together. If "none", no rescaling is done.     |
| targetAvg           | The signal(s) that either the average of the sum (if one target value) or the average of each of the alleles (if two target values) should have after calibration. Only used if rescaleBy != "none". |
| subsetToAvg         | The indices of the cells (taken as the intersect of existing indices) used to calculate average in order to rescale to the target average. If <code>NULL</code> , all probes are considered.         |
| mergeShifts         | If <code>TRUE</code> , the shift of the probe sequence relative to the SNP position is ignored, otherwise not.                                                                                       |
| B                   | An <a href="#">integer</a> specifying by how many nucleotides the allelic groups should be stratified by. If zero, all SNPs are put in one group.                                                    |
| flavor              | A <a href="#">character</a> string specifying what algorithm is used to fit the crosstalk calibration.                                                                                               |
| alpha, q, Q, lambda | Model fitting parameters.                                                                                                                                                                            |
| pairBy              | A <a href="#">character</a> string specifying how allele probe pairs are identified.                                                                                                                 |

### What probe signals are updated?

Calibration for crosstalk between allele signals applies by definition only SNP units. Furthermore, it is only SNP units with two or four unit groups that are calibrated. For instance, in at least on custom SNP CDFs we know of, there is a small number of SNP units that have six groups. *Currently these units are not calibrated (at all)*. It is only PM probes that will be calibrated. Note that, non-calibrated signals will be saved in the output files.

**What probe signals are used to fit model?**

All PM probe pairs are used to fit the crosstalk model. In the second step where signals are rescaled to a target average, it is possible to specify the set of cells that should be included when estimating the target average.

**Important about rescaling towards target average**

Rescaling each allele-pair group (e.g. AC, AG, AT, CG, CT, GC) towards a target average (rescaleBy="groups") *must not* be used for multi-enzyme chip types, e.g. GenomeWideSNP\_6. If still done, due to confounded effects of non-perfect enzyme mixtures etc, there will be a significant bias between raw CNs for SNPs and CN probes. Instead, for such chip types *all probe signals* should be rescaled together towards the target average (rescaleBy="all").

AvgPlm

*The AvgPlm class***Description**

Package: aroma.affymetrix

**Class AvgPlm****Object**

```

~~|
~~+--ParametersInterface
~~~~~|
~~~~~+--Model
~~~~~|
~~~~~+--UnitModel
~~~~~|
~~~~~+--MultiArrayUnitModel
~~~~~|
~~~~~+--ProbeLevelModel
~~~~~|
~~~~~+--AvgPlm

```

**Directly known subclasses:***AvgCnPlm, AvgSnpPlm*

```

public abstract static class AvgPlm
extends ProbeLevelModel

```

This class represents a PLM where the probe intensities are averaged assuming identical probe affinities. For instance, one may assume that replicated probes with identical sequences have the same probe affinities, cf. the GenomeWideSNP\_6 chip type.

**Usage**

```
AvgPlm(..., flavor=c("median", "mean"))
```

**Arguments**

|        |                                                                                                                                                             |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ...    | Arguments passed to <a href="#">ProbeLevelModel</a> .                                                                                                       |
| flavor | A <a href="#">character</a> string specifying what model fitting algorithm to be used. This makes it possible to get identical estimates as other packages. |

## Fields and Methods

### Methods:

*No methods defined.*

### Methods inherited from ProbeLevelModel:

calculateResidualSet, calculateWeights, fit, getAsteriskTags, getCalculateResidualsFunction, getChipEffectSet, getProbeAffinityFile, getResidualSet, getRootPath, getWeightsSet

### Methods inherited from MultiArrayUnitModel:

getListOfPriors, setListOfPriors, validate

### Methods inherited from UnitModel:

findUnitsTodo, getAsteriskTags, getFitSingleCellUnitFunction, getParameters

### Methods inherited from Model:

as.character, fit, getAlias, getAsteriskTags, getDataSet, getFullName, getName, getPath, getRootPath, getTags, setAlias, setTags

### Methods inherited from ParametersInterface:

getParameterSets, getParameters, getParametersAsString

### Methods inherited from Object:

\$. \$<-, [[, [[<-, as.character, attach, attachLocally, clearCache, clearLookupCache, clone, detach, equals, extend, finalize, getEnvironment, getFieldModifier, getFieldModifiers, getFields, getInstantiationTime, getStaticInstance, hasField, hashCode, ll, load, names, objectSize, print, save, asThis

## Model

For a single unit group, the averaging PLM of  $K$  probes is:

$$y_{ik} = \theta_i + \varepsilon_{ik}$$

where  $\theta_i$  are the chip effects for arrays  $i = 1, \dots, I$ . The  $\varepsilon_{ik}$  are zero-mean noise with equal variance.

## Different flavors of model fitting

The above model can be fitted in two ways, either robustly or non-robustly. Use argument `flavor="mean"` to fit the model non-robustly, i.e.

$$\hat{\theta}_i = 1/K \sum_k y_{ik}$$

.

Use argument `flavor="median"` to fit the model robustly, i.e.

$$\hat{\theta}_i = \text{median}_k y_{ik}$$

.

Missing values are always excluded.

CnagCfhSet                      *The CnagCfhSet class*

---

## Description

Package: aroma.affymetrix

### Class CnagCfhSet

Object

```

~~|
~~+--FullNameInterface
~~~~~|
~~~~~+--GenericDataFileSet
~~~~~|
~~~~~+--CnagCfhSet

```

### Directly known subclasses:

```

public static class CnagCfhSet
extends GenericDataFileSet

```

An CnagCfhSet object represents a set of CNAG CFH files with *identical* chip types.

## Usage

```
CnagCfhSet(files=NULL, ...)
```

## Arguments

|       |                                 |
|-------|---------------------------------|
| files | A <i>list</i> of CnagCfhFile:s. |
| ...   | Not used.                       |

## Fields and Methods

### Methods:

|                 |   |
|-----------------|---|
| as              | - |
| as.CnagCfhSet   | - |
| byName          | - |
| getAverage      | - |
| getAverageAsinh | - |
| getAverageFile  | - |
| getAverageLog   | - |
| getCdf          | - |

|               |   |
|---------------|---|
| getData       | - |
| getTimestamps | - |
| readUnits     | - |
| setCdf        | - |

#### Methods inherited from GenericDataFileSet:

[, [[, anyDuplicated, anyNA, append, appendFiles, appendFullNamesTranslator, appendFullNamesTranslatorByNULL, appendFullNamesTranslatorByTabularTextFile, appendFullNamesTranslatorByTabularTextFileSet, appendFullNamesTranslatorBydata.frame, appendFullNamesTranslatorByfunction, appendFullNamesTranslatorBylist, as.character, as.list, byName, byPath, c, clearCache, clearFullNamesTranslator, clone, copyTo, dsApplyInPairs, duplicated, equals, extract, findByName, findDuplicated, getChecksum, getChecksumFileSet, getChecksumObjects, getDefaultFullName, getFile, getFileClass, getFileSize, getFiles, getFullNames, getNames, getOneFile, getPath, getPathnames, getSubdirs, gunzip, gzip, hasFile, indexOf, is.na, names, nbrOfFiles, rep, resetFullNames, setFullNamesTranslator, sortBy, unique, update2, updateFullName, updateFullNames, validate, getFullNameTranslatorSet, getParentName

#### Methods inherited from FullNameInterface:

appendFullNameTranslator, appendFullNameTranslatorByNULL, appendFullNameTranslatorByTabularTextFile, appendFullNameTranslatorByTabularTextFileSet, appendFullNameTranslatorBycharacter, appendFullNameTranslatorBydata.frame, appendFullNameTranslatorByfunction, appendFullNameTranslatorBylist, clearFullNameTranslator, clearListOfFullNameTranslators, getDefaultFullName, getFullName, getFullNameTranslator, getListOfFullNameTranslators, getName, getTags, hasTag, hasTags, resetFullName, setFullName, setFullNameTranslator, setListOfFullNameTranslators, setName, setTags, updateFullName

#### Methods inherited from Object:

\$, \$<-, [[, [[<-, as.character, attach, attachLocally, clearCache, clearLookupCache, clone, detach, equals, extend, finalize, getEnvironment, getFieldModifier, getFieldModifiers, getFields, getInstantiationTime, getStaticInstance, hasField, hashCode, ll, load, names, objectSize, print, save, asThis

```

### Directly known subclasses:

```

public static class CnChipEffectSet
extends CopyNumberDataSet

```

This class represents estimates of chip effects in the probe-level models.

### Usage

```
CnChipEffectSet(..., combineAlleles="byFirstFile")
```

### Arguments

```

...           Arguments passed to SnpChipEffectSet.
combineAlleles A logical indicating if the signals from allele A and allele B are combined or
not.

```

### Fields and Methods

#### Methods:

```

as.CopyNumberDataSetTuple -
exportTotalAndFracB      -
extractTheta              -
extractTotalAndFreqB     -
getAverageFile            -
getCombineAlleles        -

```

```

hasAlleleBFractions      -
hasStrandiness           -
setCombineAlleles        -
writeWig                  -

```

**Methods inherited from CopyNumberDataSet:**

as, as.CopyNumberDataSet, doCBS, hasAlleleBFractions, hasStrandiness

**Methods inherited from SnpChipEffectSet:**

byPath, exportTotalAndFracB, extractAlleleSet, extractCNT, extractSnpCnvQSet, extractSnpQSet, extractTheta, extractTotalAndFreqB, getAverageFile, getBaseline, getMergeStrands, setMergeStrands, writeCNT

**Methods inherited from ChipEffectSet:**

as.character, boxplotStats, byPath, calculateBaseline, calculateFieldBoxplotStats, calculateNuseBoxplotStats, calculateRleBoxplotStats, extractAffyBatch, extractChromosomalDataFrame, extractExpressionSet, extractMatrix, extractTheta, findByName, findUnitsTodo, fromDataSet, getAM, getAsFullCelSet, getAverageFile, getBaseline, getCellIndices, getXAM, plotBoxplot, readUnits, updateUnits

**Methods inherited from ParameterCelSet:**

extractDataFrame, extractMatrix

**Methods inherited from ParametersInterface:**

getParameterSets, getParameters, getParametersAsString

**Methods inherited from AffymetrixCelSet:**

append, as, as.AffymetrixCelSet, as.character, averageQuantile, byName, byPath, clone, convertToUnique, doCRMAv1, doCRMAv2, doFIRMA, doGCRMA, doRMA, extractAffyBatch, extractFeatureSet, extractMatrix, extractSnpFeatureSet, findByName, getAverage, getAverageAsinh, getAverageFile, getAverageLog, getCdf, getChipType, getData, getIntensities, getPlatform, getTimestamps, getUnitGroupCellMap, getUnitIntensities, getUnitNamesFile, getUnitTypesFile, isDuplicated, justRMA, justSNPRMA, nbrOfArrays, normalizeQuantile, plotDensity, range, readUnits, setCdf, update2, writeSgr

**Methods inherited from AffymetrixFileSet:**

as, as.AffymetrixFileSet, byPath, getDefaultFullName

**Methods inherited from AromaPlatformInterface:**

getAromaPlatform, getAromaUflFile, getAromaUgpFile, getChipType, getPlatform, getUnitAnnotationDataFile, getUnitNamesFile, getUnitTypesFile, isCompatibleWith

**Methods inherited from AromaMicroarrayDataSet:**

as.AromaMicroarrayDataSetList, as.AromaMicroarrayDataSetTuple, getAromaFullNameTranslatorSet, getAverageFile, getChipType, getDefaultFullName, getPlatform, setAttributesBy, setAttributesBySampleAnnotationFile, setAttributesBySampleAnnotationSet, validate

```

public class CnPlm
extends SnpPlm

```

This support class represents a [SnpPlm](#) specially designed for copy-number analysis.

**Usage**

```
CnPlm(...)
```

**Arguments**

```
...           Arguments passed to SnpPlm.
```

**Details**

Models implementing this copy-number PLM, provides either allele-specific or total copy-number estimates. For allele-specific CNs the underlying [SnpPlm](#) model is fitted as is, i.e. for each allele separately with or without the strands first being merged.

For total CNs the probe signals for the two alleles are combined (=summed; not averaged) on the intensity scale before fitting underlying [SnpPlm](#) model, again with or without the strands first being merged.

**Methods****Methods:**

```
getCellIndices      -
getChipEffectSet    -
getCombineAlleles   -
getProbeAffinityFile -
setCombineAlleles   -
```

**Methods inherited from SnpPlm:**

```
getCellIndices, getChipEffectSet, getMergeStrands, getParameters, getProbeAffinityFile, setMergeS-
trands
```

**Methods inherited from Interface:**

```
extend, print, uses
```

**Requirements**

Classes inheriting from this [Interface](#) must provide the following fields, in addition to the ones according to [SnpPlm](#):

- combineAllelesA [logical](#) indicating if total or allele-specific copy numbers should be estimated according to the above averaging.

~~~~~|
~~~~~+--SnpProbeAffinityFile
~~~~~|
~~~~~+--CnProbeAffinityFile

```

#### Directly known subclasses:

```

public abstract static class CnProbeAffinityFile
extends SnpProbeAffinityFile

```

This class represents estimates of probe affinities in SNP probe-level models.

**Usage**

```
CnProbeAffinityFile(..., combineAlleles=FALSE)
```

**Arguments**

... Arguments passed to [SnpProbeAffinityFile](#).

combineAlleles If [FALSE](#), allele A and allele B are treated separately, otherwise together.

**Fields and Methods****Methods:**

*No methods defined.*

**Methods inherited from SnpProbeAffinityFile:**

getCellIndices, setMergeStrands

**Methods inherited from ProbeAffinityFile:**

as.character, getCellIndices, getParameters, readUnits

**Methods inherited from ParameterCelFile:**

extractDataFrame, extractMatrix, readUnits

**Methods inherited from ParametersInterface:**

getParameterSets, getParameters, getParametersAsString

**Methods inherited from AffymetrixCelFile:**

allocateFromCdf, as.character, clone, createFrom, extractMatrix, fromFile, getAm, getCdf, getExtensionPattern, getFileFormat, getImage, getUnitNamesFile, getUnitTypesFile, highlight, image270, nbrOfCells, plotDensity, plotImage, plotMvsA, plotMvsX, range, setCdf, smoothScatterMvsA, writeImage

**Methods inherited from AromaPlatformInterface:**

getAromaPlatform, getAromaUflFile, getAromaUgpFile, getChipType, getPlatform, getUnitAnnotationDataFile, getUnitNamesFile, getUnitTypesFile, isCompatibleWith

**Methods inherited from AromaMicroarrayDataFile:**

getAttributeXY, getChipType, getPlatform, getPloidy, getXAM, hasAttributeXY, isAverageFile, setAttributeXY, setAttributesByTags

**Methods inherited from FileCacheKeyInterface:**

getCacheKey

**Methods inherited from CacheKeyInterface:**

getCacheKey

**Methods inherited from GenericDataFile:**

as.character, clone, compareChecksum, copyTo, equals, fromFile, getAttribute, getAttributes, getChecksum, getChecksumFile, getCreatedOn, getDefaultFullName, getExtension, getExtensionPattern, getFileSize, getFileType, getFilename, getFilenameExtension, getLastAccessedOn, getLastModifiedOn, getOutputExtension, getPath, getPathname, gunzip, gzip, hasBeenModified, is.na, isFile, isGzipped, linkTo, readChecksum, renameTo, renameToUpperCaseExt, setAttribute, setAttributes, setAttributesBy, setAttributesByTags, setExtensionPattern, testAttributes, validate, validateChecksum, writeChecksum, getParentName

**Methods inherited from FullNameInterface:**

appendFullNameTranslator, appendFullNameTranslatorByNULL, appendFullNameTranslatorByTabularTextFile, appendFullNameTranslatorByTabularTextFileSet, appendFullNameTranslatorBycharacter, appendFullNameTranslatorBydata.frame, appendFullNameTranslatorByfunction, appendFullNameTranslatorBylist, clearFullNameTranslator, clearListOfFullNameTranslators, getDefaultFullName, getFullName, getFullNameTranslator, getListOfFullNameTranslators, getName, getTags, hasTag, hasTags, resetFullName, setFullName, setFullNameTranslator, setListOfFullNameTranslators, setName, setTags, updateFullName

**Methods inherited from Object:**

DChipGenomeInformation

The DChipGenomeInformation class

Description

Package: aroma.affymetrix

Class DChipGenomeInformation

Object

```

~|
~+--FullNameInterface
~~~~~|
~~~~~+--GenericDataFile
~~~~~|
~~~~~+--CacheKeyInterface
~~~~~|
~~~~~+--FileCacheKeyInterface
~~~~~|
~~~~~+--GenomeInformation
~~~~~|
~~~~~+--DChipGenomeInformation

```

Directly known subclasses:

public abstract static class **DChipGenomeInformation**
 extends *GenomeInformation*

This class represents dChip genome information files, which typically contains information about chromosomal locations of the units.

Usage

```
DChipGenomeInformation(...)
```

Arguments

... Arguments passed to *GenomeInformation*.

Details

The dChip genome information files for various chip types can be downloaded from <https://sites.google.com/site/dchipsoft/>. Put each file in a directory named identically as the corresponding chip type under the *annotations/* directory, e.g. *annotations/Mapping50K_Hind240/50k_hind_genome_info_AfAm_june_05_hg17.xls*. Note that dChip changes the filename and file format

slightly between chip types, but currently the `*byChipType()` basically searches for files with names consisting of "genome info" or "genome_info". At least for the most common chip types, there is no need to rename the files in order for this class to recognize them.

Fields and Methods

Methods:

```
byChipType      -
readDataFrame   -
```

Methods inherited from GenomeInformation:

as.character, byChipType, fromCdf, fromDataSet, getChipType, getChromosomeStats, getChromosomes, getData, getPositions, getUnitIndices, getUnitsOnChromosome, getUnitsOnChromosomes, isCompatibleWithCdf, nbrOfUnits, plotDensity, readDataFrame, verify

Methods inherited from FileCacheKeyInterface:

DChipQuantileNormalization

The DChipQuantileNormalization class

Description

Package: aroma.affymetrix

Class DChipQuantileNormalization

Object

```

~~|
~~+--ParametersInterface
~~~~~|
~~~~~+--AromaTransform
~~~~~|
~~~~~+--Transform
~~~~~|
~~~~~+--ProbeLevelTransform
~~~~~|
~~~~~+--QuantileNormalization
~~~~~|
~~~~~+--DChipQuantileNormalization

```

Directly known subclasses:

```

public static class DChipQuantileNormalization
extends QuantileNormalization

```

This class represents a special [QuantileNormalization](#) using smooth-splines.

Usage

```
DChipQuantileNormalization(..., robust=FALSE)
```

Arguments

| | |
|--------|-----------------------------------------------------------------------------------|
| ... | Arguments passed to the constructor of QuantileNormalization . |
| robust | If TRUE , the normalization function is estimated robustly, otherwise not. |

Details

This normalization method implements the two-pass algorithm described in Bengtsson et al. (2008).

Fields and Methods**Methods:**

process -

Methods inherited from QuantileNormalization:

findTargetDistributionFile, getParameters, process

Methods inherited from ProbeLevelTransform:

getRootPath

Methods inherited from Transform:

getOutputDataSet, getOutputFiles

Methods inherited from AromaTransform:

doCRMAv1

Estimation and assessment of raw copy numbers at the single locus level (CRMA v1)

Description

Estimation and assessment of raw copy numbers at the single locus level (CRMA v1) based on [1]. The algorithm is processed in bounded memory, meaning virtually any number of arrays can be analyzed on also very limited computer systems.

Usage

```
## S3 method for class 'AffymetrixCelSet'
doCRMAv1(csR, shift=+300, combineAlleles=TRUE, lengthRange=NULL, arrays=NULL, drop=TRUE,
  verbose=FALSE, ...)
## Default S3 method:
doCRMAv1(dataSet, ..., verbose=FALSE)
## Default S3 method:
doASCRMAv1(...)
```

Arguments

| | |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------|
| csR, dataSet | An AffymetrixCelSet (or the name of an AffymetrixCelSet). |
| shift | An tuning parameter specifying how much to shift the probe signals before probe summarization. |
| combineAlleles | A logical specifying whether allele probe pairs should be summed before modeling or not. |
| lengthRange | An optional numeric vector of length two passed to FragmentLengthNormalization . |
| arrays | A integer vector specifying the subset of arrays to process. If NULL , all arrays are considered. |
| drop | If TRUE , the summaries are returned, otherwise a named list of all intermediate and final results. |
| verbose | See Verbose . |
| ... | Additional arguments used to set up AffymetrixCelSet (when argument dataSet is specified). |

Value

Returns a named [list](#), iff drop == FALSE, otherwise only [ChipEffectSet](#) object.

Allele-specific or only total-SNP signals

If you wish to obtain allele-specific estimates for SNPs, which are needed to call genotypes or infer parent-specific copy numbers, then use argument `combineAlleles=FALSE`. Total copy number signals are still available. If you know for certain that you will not use allele-specific estimates, you will get slightly less noisy signals (very small difference) if you use `combineAlleles=TRUE`.

`doASCRMAv1(...)` is a wrapper for `doCRMAv1(..., combineAlleles=FALSE)`.

| | |
|----------|--------------------------------------------------------------------------------------------------------------------------------------------|
| doCRMAv2 | <i>A single-array preprocessing method for estimating full-resolution raw copy numbers from all Affymetrix genotyping arrays (CRMA v2)</i> |
|----------|--------------------------------------------------------------------------------------------------------------------------------------------|

Description

A single-array preprocessing method for estimating full-resolution raw copy numbers from all Affymetrix genotyping arrays (CRMA v2) based on [1]. The algorithm is processed in bounded memory, meaning virtually any number of arrays can be analyzed on also very limited computer systems.

We recommend CRMA v2 for estimating allele-specific as well total SNP signals from Affymetrix SNP chips.

Usage

```
## S3 method for class 'AffymetrixCelSet'
doCRMAv2(csR, combineAlleles=TRUE, lengthRange=NULL, arrays=NULL,
  plm=c("AvgCnPlm", "RmaCnPlm"), drop=TRUE, verbose=FALSE, ...)
## Default S3 method:
doCRMAv2(dataSet, ..., verbose=FALSE)
## Default S3 method:
doASCRMAv2(...)
```

Arguments

| | |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------|
| csR, dataSet | An AffymetrixCelSet (or the name of an AffymetrixCelSet). |
| combineAlleles | A logical specifying whether allele probe pairs should be summed before modeling or not. |
| lengthRange | An optional numeric vector of length two passed to FragmentLengthNormalization . |
| arrays | A integer vector specifying the subset of arrays to process. If NULL , all arrays are considered. |
| plm | A character string specifying which type of probe-summarization model to used. |
| drop | If TRUE , the summaries are returned, otherwise a named list of all intermediate and final results. |
| verbose | See Verbose . |
| ... | Additional arguments used to set up AffymetrixCelSet (when argument dataSet is specified). |

Value

Returns a named [list](#), iff `drop == FALSE`, otherwise only [ChipEffectSet](#) object.

Allele-specific or only total-SNP signals

If you wish to obtain allele-specific estimates for SNPs, which are needed to call genotypes or infer parent-specific copy numbers, then use argument `combineAlleles=FALSE`. Total copy number signals are still available. If you know for certain that you will not use allele-specific estimates, you will get slightly less noisy signals (very small difference) if you use `combineAlleles=TRUE`.

`doASCRMAv2(...)` is a wrapper for `doCRMAv2(..., combineAlleles=FALSE)`.

doFIRMA

Finding Isoforms using Robust Multichip Analysis (FIRMA)

Description

Finding Isoforms using Robust Multichip Analysis (FIRMA) based on [1].

Usage

```
## S3 method for class 'AffymetrixCelSet'
doFIRMA(csR, ..., flavor=c("v1b", "v1a"), drop=TRUE, verbose=FALSE)
## Default S3 method:
doFIRMA(dataSet, ..., verbose=FALSE)
```

Arguments

`csR`, `dataSet` An [AffymetrixCelSet](#) (or the name of an [AffymetrixCelSet](#)).

`...` Additional arguments passed to [FirmaModel](#), and to set up [AffymetrixCelSet](#) (when argument `dataSet` is specified).

`flavor` A [character](#) string specifying the flavor of FIRMA to use.

| | |
|---------|----------------------------------------------------------------------------------------------------------------------|
| drop | If TRUE , the FIRMA scores are returned, otherwise a named list of all intermediate and final results. |
| verbose | See Verbose . |

Value

Returns a named **list**, iff drop == FALSE, otherwise only **FirmaSet** object (containing the FIRMA scores).

Using a custom exon-by-transcript CDF

It is strongly recommended to use a custom CDF, e.g. "core", "extended" or "full" [1]. To use a custom CDF, set it before calling this method, i.e. `setCdf(csR, cdf)`. Do not set the standard "non-supported" Affymetrix CDF (see also Section 'Flavors').

Flavors

If `flavor == "v1b"` (default), then the standard "non-supported" Affymetrix CDF is used for background correction and the quantile normalization steps, and the custom CDF is used for the probe summarization and everything that follows. The advantage of this flavor is that those two first preprocessing steps will remain the same if one later changes to a different custom CDF.

If `flavor == "v1a"`, then the custom CDF is used throughout all steps of FIRMA, which means that if one changes the custom CDF all steps will be redone.

Description

Robust Multichip Analysis (GCRMA) based on [1]. The algorithm is processed in bounded memory, meaning virtually any number of arrays can be analyzed on also very limited computer systems. The method replicates the results of [gcrma](#) (package **gcrma**) with great precision.

Usage

```
## S3 method for class 'AffymetrixCelSet'
doGCRMA(csR, arrays=NULL, type=c("fullmodel", "affinities"), uniquePlm=FALSE, drop=TRUE,
  verbose=FALSE, ...)
## Default S3 method:
doGCRMA(dataSet, ..., verbose=FALSE)
```

Arguments

| | |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| csR, dataSet | An AffymetrixCelSet (or the name of an AffymetrixCelSet). |
| arrays | A integer vector specifying the subset of arrays to process. If NULL , all arrays are considered. |
| type | A character string specifying what type of model to use for the GCRMA background correction. For more details, see GcRmaBackgroundCorrection . |
| uniquePlm | If TRUE , the log-additive probe-summarization model is done on probeset with <i>unique</i> sets of probes. If FALSE , the summarization is done on "as-is" probesets as specified by the CDF. |
| drop | If TRUE , the summaries are returned, otherwise a named list of all intermediate and final results. |
| verbose | See Verbose . |
| ... | Additional arguments used to set up AffymetrixCelSet (when argument dataSet is specified). |

Value

Returns a named [list](#), iff drop == FALSE, otherwise only [ChipEffectSet](#) object.

Description

Robust Multichip Analysis (RMA) based on [1]. The algorithm is processed in bounded memory, meaning virtually any number of arrays can be analyzed on also very limited computer systems. The method replicates the results of [fitPLM](#) (package [affyPLM](#)) with great precision.

Usage

```
## S3 method for class 'AffymetrixCelSet'
doRMA(csR, arrays=NULL, flavor=c("affyPLM", "oligo"), uniqueP1m=FALSE, drop=TRUE,
      verbose=FALSE, ...)
## Default S3 method:
doRMA(dataSet, ..., verbose=FALSE)
```

Arguments

| | |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| csR, dataSet | An AffymetrixCelSet (or the name of an AffymetrixCelSet). |
| arrays | A integer vector specifying the subset of arrays to process. If <code>NULL</code> , all arrays are considered. |
| flavor | A character string specifying what model fitting algorithm to be used, cf. RmaP1m . |
| uniqueP1m | If <code>TRUE</code> , the log-additive probe-summarization model is done on probeset with <i>unique</i> sets of probes. If <code>FALSE</code> , the summarization is done on "as-is" probesets as specified by the CDF. |
| drop | If <code>TRUE</code> , the summaries are returned, otherwise a named list of all intermediate and final results. |
| verbose | See Verbose . |
| ... | Additional arguments used to set up AffymetrixCelSet (when argument <code>dataSet</code> is specified). |

Value

Returns a named [list](#), iff `drop == FALSE`, otherwise only [ChipEffectSet](#) object.

ExonRmaPlm

*The ExonRmaPlm class***Description**

Package: aroma.affymetrix

Class ExonRmaPlm**Object**

```

~|
~+--ParametersInterface
~~~~~|
~~~~~+--Model
~~~~~|
~~~~~+--UnitModel
~~~~~|
~~~~~+--MultiArrayUnitModel
~~~~~|
~~~~~+--ProbeLevelModel
~~~~~|
~~~~~+--RmaPlm
~~~~~|
~~~~~+--ExonRmaPlm

```

Directly known subclasses:

```

public abstract static class ExonRmaPlm
extends RmaPlm

```

This class represents the log-additive model part of the Robust Multichip Analysis (RMA) method described in Irizarry et al (2003), as implemented for exon arrays. The model may be fitted with exons merged into transcripts (all probes fitted together) or on an individual exon basis (probes within an exon treated as a group, but exons fitted separately).

Usage

```

ExonRmaPlm(..., mergeGroups=TRUE)

```

Arguments

```

...           Arguments passed to RmaPlm.
mergeGroups  A logical flag specifying whether to merge exons into transcripts.

```

Fields and Methods**Methods:**

```

getCellIndices -
getChipEffectSet -
getProbeAffinityFile -
setMergeGroups -

```

Methods inherited from RmaPlm:

getAsteriskTags, getCalculateResidualsFunction, getParameters, getRlmFitFunctions

Methods inherited from ProbeLevelModel:

calculateResidualSet, calculateWeights, fit, getAsteriskTags, getCalculateResidualsFunction, getChipEffectSet, getProbeAffinityFile, getResidualSet, getRootPath, getWeightsSet

Methods inherited from MultiArrayUnitModel:

getListOfPriors, setListOfPriors, validate

Methods inherited from UnitModel:

findUnitsTodo, getAsteriskTags, getFitSingleCellUnitFunction, getParameters

Methods inherited from Model:

as.character, fit, getAlias, getAsteriskTags, getDataSet, getFullName, getName, getPath, getRootPath, getTags, setAlias, setTags

Methods inherited from ParametersInterface:

getParameterSets, getParameters, getParametersAsString

Methods inherited from Object:

\$. \$<-, [], [[<-, as.character, attach, attachLocally, clearCache, clearLookupCache, clone, detach, equals, extend, finalize, getEnvironment, getFieldModifier, getFieldModifiers, getFields, getInstantiationTime, getStaticInstance, hasField, hashCode, ll, load, names, objectSize, print, save, asThis

FirmaModel

The FirmaModel class

Description

Package: aroma.affymetrix

Class FirmaModel**Object**

```

~~|
~~+--ParametersInterface
~~~~~|
~~~~~+--Model
~~~~~|
~~~~~+--UnitModel
~~~~~|
~~~~~+--FirmaModel

```

Directly known subclasses:

```

public abstract static class FirmaModel
extends UnitModel

```

This class represents the FIRMA (Finding Isoforms using RMA) alternative splicing model.

Usage

```

FirmaModel(rmaPlm=NULL, summaryMethod=c("median", "upperQuartile", "max"),
  operateOn=c("residuals", "weights"), ...)

```

Arguments

| | |
|---------------|----------------------------------------------------------------------------------|
| rmaPlm | An @RmaPlm object. |
| summaryMethod | A character specifying what summarization method should be used. |
| operateOn | A character specifying what statistic to operate on. |
| ... | Arguments passed to constructor of UnitModel . |

Fields and Methods**Methods:**

| | |
|-------------|---|
| fit | - |
| getCdf | - |
| getDataSet | - |
| getFirmaSet | - |
| getName | - |
| getPlm | - |
| getTags | - |

Methods inherited from UnitModel:

findUnitsTodo, getAsteriskTags, getFitSingleCellUnitFunction, getParameters

Methods inherited from Model:

as.character, fit, getAlias, getAsteriskTags, getDataSet, getFullName, getName, getPath, getRootPath, getTags, setAlias, setTags

 FragmentEquivalentClassNormalization

The FragmentEquivalentClassNormalization class

Description

Package: aroma.affymetrix

Class FragmentEquivalentClassNormalization

Object

```

~~|
~~+--ParametersInterface
~~~~~|
~~~~~+--AromaTransform
~~~~~|
~~~~~+--Transform
~~~~~|
~~~~~+--ChipEffectTransform
~~~~~|
~~~~~+--FragmentEquivalentClassNormalization
  
```

Directly known subclasses:

public static class **FragmentEquivalentClassNormalization**

extends *ChipEffectTransform*

This class represents a normalization method that corrects for systematic effects between loci of different equivalent classes of pairs of sequences that are recognized by the restriction enzymes that cut the DNA studies.

Usage

```

FragmentEquivalentClassNormalization(dataSet=NULL, ..., targetAvg=NULL,
  subsetToFit="-XY")
  
```

Arguments

| | |
|-------------|----------------------------------------------------------------------------------------------------------------------------------|
| dataSet | A <i>CnChipEffectSet</i> . |
| ... | Additional arguments passed to the constructor of <i>ChipEffectTransform</i> . |
| targetAvg | An optional list of <i>functions</i> . For each enzyme there is one target averages to which all arrays should be normalized to. |
| subsetToFit | The units from which the normalization curve should be estimated. If <i>NULL</i> , all are considered. |

Fields and Methods**Methods:**

```

getAromaUfcFile -
getCdf          -
process        -

```

Methods inherited from ChipEffectTransform:

```
getRootPath
```

Methods inherited from Transform:

```
getOutputDataSet, getOutputFiles
```

Methods inherited from AromaTransform:

```

as.character, findFilesTodo, getAsteriskTags, getExpectedOutputFiles, getExpectedOutputFullnames,
getFullName, getInputDataSet, getName, getOutputDataSet, getOutputDataSet0, getOutputFiles,
getPath, getRootPath, getTags, isDone, process, setTags

```

Methods inherited from ParametersInterface:

```
getParameterSets, getParameters, getParametersAsString
```

Methods inherited from Object:

```

$, $<-, [], [[<-, as.character, attach, attachLocally, clearCache, clearLookupCache, clone, detach,
equals, extend, finalize, getEnvironment, getFieldModifier, getFieldModifiers, getFields, getInstan-
tiationTime, getStaticInstance, hasField, hashCode, ll, load, names, objectSize, print, save, asThis

```

Requirements

This class requires an UFC (Unit Fragment Class) annotation file.

Acknowledgments

The idea of normalization signals stratified on enzyme recognition sequences is credited to Jim Veitch and Ben Bolstad at Affymetrix Inc. (2008) who have designed a similar method for copy number estimation in the Affymetrix' Genotype Console v2.

FragmentLengthNormalization

The FragmentLengthNormalization class

Description

Package: aroma.affymetrix

Class FragmentLengthNormalization**Object**

```

~|
~+--ParametersInterface
~~~~~|
~~~~~+--AromaTransform
~~~~~|
~~~~~+--Transform
~~~~~|
~~~~~+--ChipEffectTransform
~~~~~|
~~~~~+--FragmentLengthNormalization

```

Directly known subclasses:

public static class **FragmentLengthNormalization**

extends *ChipEffectTransform*

This class represents a normalization method that corrects for PCR fragment length effects on copy-number chip-effect estimates.

Usage

```
FragmentLengthNormalization(dataSet=NULL, ..., target=targetFunctions, subsetToFit="-XY",
lengthRange=NULL, onMissing=c("median", "ignore"), shift=0, targetFunctions=NULL)
```

Arguments

| | |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dataSet | A <i>SnpChipEffectSet</i> . |
| ... | Additional arguments passed to the constructor of <i>ChipEffectTransform</i> . |
| target | (Optional) A character string or a list of functions specifying what to normalize toward. For each enzyme there is one target function to which all arrays should be normalized to. |
| subsetToFit | The units from which the normalization curve should be estimated. If NULL , all are considered. |
| lengthRange | If given, a numeric vector of length 2 specifying the range of fragment lengths considered. All fragments with lengths outside this range are treated as if they were missing. |
| onMissing | Specifies how to normalize units for which the fragment lengths are unknown. |
| shift | An optional amount the data points should be shifted (translated). |
| targetFunctions | Deprecated. |

Details

For SNPs, the normalization function is estimated based on the total chip effects, i.e. the sum of the allele signals. The normalizing is done by rescale the chip effects on the intensity scale such that the mean of the total chip effects are the same across samples for any given fragment length. For allele-specific estimates, both alleles are always rescaled by the same amount. Thus, when normalizing allele-specific chip effects, the total chip effects is change, but not the relative allele signal, e.g. the allele B frequency.

Fields and Methods**Methods:**

```
getCdf    -
process   -
```

Methods inherited from ChipEffectTransform:

```
getRootPath
```

Methods inherited from Transform:

```
getOutputDataSet, getOutputFiles
```

Methods inherited from AromaTransform:

```
as.character, findFilesTodo, getAsteriskTags, getExpectedOutputFiles, getExpectedOutputFullnames,
getFullName, getInputDataSet, getName, getOutputDataSet, getOutputDataSet0, getOutputFiles,
getPath, getRootPath, getTags, isDone, process, setTags
```

Methods inherited from ParametersInterface:

```
getParameterSets, getParameters, getParametersAsString
```

Methods inherited from Object:

```
$/, $<-, [], [[<-, as.character, attach, attachLocally, clearCache, clearLookupCache, clone, detach,
equals, extend, finalize, getEnvironment, getFieldModifier, getFieldModifiers, getFields, getInstan-
tiationTime, getStaticInstance, hasField, hashCode, ll, load, names, objectSize, print, save, asThis
```

Requirements

This class requires a SNP information annotation file for the chip type to be normalized.

GcContentNormalization2

The GcContentNormalization2 class

Description

Package: aroma.affymetrix

Class GcContentNormalization2**Object**

```

~~|
~~+--ParametersInterface
~~~~~|
~~~~~+--AromaTransform
~~~~~|
~~~~~+--Transform
~~~~~|
~~~~~+--ChipEffectTransform
~~~~~|
~~~~~+--AdditiveCovariatesNormalization
~~~~~|
~~~~~+--GcContentNormalization2

```

Directly known subclasses:

public static class **GcContentNormalization2**
 extends *AdditiveCovariatesNormalization*

This class represents a normalization method that corrects for annotation-data covariate effects on copy-number chip-effect estimates.

Usage

```
GcContentNormalization2(...)
```

Arguments

... Arguments passed to the constructor of *AdditiveCovariatesNormalization*.

Fields and Methods**Methods:**

plotCovariateEffects -

Methods inherited from AdditiveCovariatesNormalization:

getAsteriskTags, getCdf, getCovariates, getOutputDataSet00, getParameters, process

Methods inherited from ChipEffectTransform:

getRootPath

Methods inherited from Transform:

getOutputDataSet, getOutputFiles

Methods inherited from AromaTransform:

GcRmaBackgroundCorrection

The GcRmaBackgroundCorrection class

Description

Package: aroma.affymetrix

Class GcRmaBackgroundCorrection

Object

```

~~|
~~+--ParametersInterface
~~~~~|
~~~~~+--AromaTransform
~~~~~|
~~~~~+--Transform
~~~~~|
~~~~~+--ProbeLevelTransform
~~~~~|
~~~~~+--BackgroundCorrection
~~~~~|
~~~~~+--GcRmaBackgroundCorrection

```

Directly known subclasses:

```

public static class GcRmaBackgroundCorrection
extends BackgroundCorrection

```

This class represents the GCRMA background adjustment function.

Usage

```

GcRmaBackgroundCorrection(..., indicesNegativeControl=NULL, affinities=NULL,
  type=c("fullmodel", "affinities"), opticalAdjust=TRUE, gsbAdjust=TRUE,
  gsbParameters=NULL, seed=NULL)

```

Arguments

```

...           Arguments passed to the constructor of ProbeLevelTransform.
indicesNegativeControl
              Locations of any negative control probes (e.g., the anti-genomic controls on
              the human exon array). If NULL and type == "affinities", then all non-PM
              probes are used as the negative controls.

```

| | |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| affinities | A numeric vector of probe affinities, usually as calculated by <code>computeAffinities()</code> of the <code>AffymetrixCdfFile</code> class. |
| type | Type (flavor) of background correction, which can be either "fullmodel" (uses MMs; requires that the chip type has PM/MM pairs) or "affinities" (uses probe sequence only). |
| gsbAdjust | If TRUE , adjustment for specific binding is done, otherwise not. |
| opticalAdjust | If TRUE , correction for optical effect is done first, utilizing <code>OpticalBackgroundCorrection</code> . |
| gsbParameters | Additional argument passed to the internal <code>bgAdjustGcrma()</code> method. |
| seed | An (optional) integer specifying a temporary random seed to be used during processing. The random seed is set to its original state when done. If NULL , it is not set. |

Fields and Methods

Methods:

process -

Methods inherited from BackgroundCorrection:

`getParameters`, `process`

Robust Multichip Analysis (RMA) reproducing the affy package

Description

Robust Multichip Analysis (RMA) reproducing the affy package as far as possible. The RMA method is described in [1].

The algorithm is processed in bounded memory, meaning a very large number of arrays can be analyzed on also very limited computer systems. The only limitation is the amount of memory required to load the final chip-effect estimates into memory (as a [ExpressionSet](#)).

Usage

```
## S3 method for class 'AffymetrixCelSet'
justRMA(csR, flavor=c("oligo", "affyPLM"), ..., verbose=FALSE)
## Default S3 method:
justRMA(...)
```

Arguments

| | |
|---------|--------------------------------------------------------------------------------------------------|
| csR | An AffymetrixCelSet . |
| flavor | A character string specifying the estimators used in the RMA summarization step. |
| ... | Additional arguments passed to doRMA() used internally. |
| verbose | See Verbose . |

Value

Returns an annotated [ExpressionSet](#).

Reproducibility of affy

This implementation of the RMA method reproduces [justRMA](#) in [affy](#) package quite well. It does so by still using a constant memory profile, i.e. it is possible to use this implementation to run RMA on a much large data set than what is possible with [affy](#). At least 20-50 *times* more samples should be doable, if not more.

`LimmaBackgroundCorrection`*The LimmaBackgroundCorrection class*

Description

Package: aroma.affymetrix

Class LimmaBackgroundCorrection**Object**

```

~~|
~~+--ParametersInterface
~~~~~|
~~~~~+--AromaTransform
~~~~~|
~~~~~+--Transform
~~~~~|
~~~~~+--ProbeLevelTransform
~~~~~|
~~~~~+--BackgroundCorrection
~~~~~|
~~~~~+--LimmaBackgroundCorrection

```

Directly known subclasses:[NormExpBackgroundCorrection](#)public static class **LimmaBackgroundCorrection**extends *BackgroundCorrection*

This class represents the various "background" correction methods implemented in the **limma** package.

Usage

```
LimmaBackgroundCorrection(..., args=NULL, addJitter=FALSE, jitterSd=0.2, seed=6022007)
```

Arguments

| | |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ... | Arguments passed to the constructor of BackgroundCorrection . |
| args | A list of additional arguments passed to the correction algorithm. |
| addJitter | If TRUE , Zero-mean gaussian noise is added to the signals before being background corrected. |
| jitterSd | Standard deviation of the jitter noise added. |
| seed | An (optional) integer specifying a temporary random seed to be used for generating the (optional) jitter. The random seed is set to its original state when done. If NULL , it is not set. |

Details

By default, only PM signals are background corrected and MMs are left unchanged.

Fields and Methods**Methods:**

process -

Methods inherited from BackgroundCorrection:

getParameters, process

Methods inherited from ProbeLevelTransform:

getRootPath

Methods inherited from Transform:

getOutputDataSet, getOutputFiles

Methods inherited from AromaTransform:

as.character, findFilesTodo, getAsteriskTags, getExpectedOutputFiles, getExpectedOutputFullnames, getFullName, getInputDataSet, getName, getOutputDataSet, getOutputDataSet0, getOutputFiles, getPath, getRootPath, getTags, isDone, process, setTags

Methods inherited from ParametersInterface:

getParameterSets, getParameters, getParametersAsString

Methods inherited from Object:

\$, \$<-, [[, [[<-, as.character, attach, attachLocally, clearCache, clearLookupCache, clone, detach, equals, extend, finalize, getEnvironment, getFieldModifier, getFieldModifiers, getFields, getInstantiationTime, getStaticInstance, hasField, hashCode, ll, load, names, objectSize, print, save, asThis

Jitter noise

The fitting algorithm of the normal+exponential background correction model may not converge if there too many small and discrete signals. To overcome this problem, a small amount of noise may be added to the signals before fitting the model. This is an ad hoc solution that seems to work. However, adding Gaussian noise may generate non-positive signals.

Author(s)

Henrik Bengtsson. Adopted from RmaBackgroundCorrection by Ken Simpson.

Internally, [backgroundCorrect](#) is used.

LinearModelProbeSequenceNormalization

The LinearModelProbeSequenceNormalization class

Description

Package: aroma.affymetrix

Class LinearModelProbeSequenceNormalization**Object**

```

~~|
~~+--ParametersInterface
~~~~~|
~~~~~+--AromaTransform
~~~~~|
~~~~~+--Transform
~~~~~|
~~~~~+--ProbeLevelTransform
~~~~~|
~~~~~+--ProbeLevelTransform3
~~~~~|
~~~~~+--AbstractProbeSequenceNormalization
~~~~~|
~~~~~+--LinearModelProbeSequenceNormalization

```

Directly known subclasses:

[BasePositionNormalization](#)

```

public abstract static class LinearModelProbeSequenceNormalization
extends AbstractProbeSequenceNormalization

```

This abstract class represents a normalization method that corrects for systematic effects in the probe intensities due to probe-sequence dependent effects that can be modeled using a linear model.

Usage

```
LinearModelProbeSequenceNormalization(...)
```

Arguments

... Arguments passed to the constructor of [AbstractProbeSequenceNormalization](#).

Fields and Methods**Methods:**

No methods defined.

Methods inherited from AbstractProbeSequenceNormalization:

fitOne, getAromaCellSequenceFile, getParameters, getTargetFile, indexOfMissingSequences, predictOne, process

Methods inherited from ProbeLevelTransform3:

getAsteriskTags, getCellsTo, getCellsToFit, getCellsToUpdate, getParameters, getUnitsTo, getUnitsToFit, getUnitsToUpdate, writeSignals

Methods inherited from ProbeLevelTransform:

getRootPath

Methods inherited from Transform:

getOutputDataSet, getOutputFiles

Methods inherited from AromaTransform:

as.character, findFilesTodo, getAsteriskTags, getExpectedOutputFiles, getExpectedOutputFullnames, getFullName, getInputDataSet, getName, getOutputDataSet, getOutputDataSet0, getOutputFiles, getPath, getRootPath, getTags, isDone, process, setTags

Methods inherited from ParametersInterface:

getParameterSets, getParameters, getParametersAsString

Methods inherited from Object:

\$, \$<-, [], [[<-, as.character, attach, attachLocally, clearCache, clearLookupCache, clone, detach, equals, extend, finalize, getEnvironment, getFieldModifier, getFieldModifiers, getFields, getInstantiationTime, getStaticInstance, hasField, hashCode, ll, load, names, objectSize, print, save, asThis

Requirements

This class requires that an aroma probe sequence file is available for the chip type.

Memory usage

The model fitting methods of this class are bounded in memory. This is done by first building up the normal equations incrementally in chunks of cells. The generation of normal equations is otherwise the step that consumes the most memory. When the normal equations are available, the [solve\(\)](#) method is used to solve the equations. Note that this algorithm is still exact.

 MatNormalization *The MatNormalization class*

Description

Package: aroma.affymetrix

Class MatNormalization

Object

```

~~|
~~+--ParametersInterface
~~~~~|
~~~~~+--AromaTransform
~~~~~|
~~~~~+--Transform
~~~~~|
~~~~~+--ProbeLevelTransform
~~~~~|
~~~~~+--ProbeLevelTransform3
~~~~~|
~~~~~+--AbstractProbeSequenceNormalization
~~~~~|
~~~~~+--MatNormalization
  
```

Directly known subclasses:

```

public static class MatNormalization
  extends AbstractProbeSequenceNormalization
  
```

This class represents a normalization method that corrects for systematic effects in the probe intensities due to differences in the number of A, C, G, and T:s and the match scores according to MAT [1].

Usage

```
MatNormalization(..., unitsToFit=NULL, model=c("lm"), nbrOfBins=200)
```

Arguments

| | |
|------------|--------------------------------------------------------------------------------------------------------|
| ... | Arguments passed to the constructor of <i>AbstractProbeSequenceNormalization</i> . |
| unitsToFit | The units from which the normalization curve should be estimated. If <i>NULL</i> , all are considered. |
| model | A <i>character</i> string specifying the model used to fit the base-count effects. |
| nbrOfBins | The number of bins to use for the variance smoothing step. |

Fields and Methods**Methods:**

process -

Methods inherited from AbstractProbeSequenceNormalization:

fitOne, getAromaCellSequenceFile, getParameters, getTargetFile, indexOfMissingSequences, predictOne, process

Methods inherited from ProbeLevelTransform3:

getAsteriskTags, getCellsTo, getCellsToFit, getCellsToUpdate, getParameters, getUnitsTo, getUnitsToFit, getUnitsToUpdate, writeSignals

Methods inherited from ProbeLevelTransform:

getRootPath

Methods inherited from Transform:

getOutputDataSet, getOutputFiles

Methods inherited from AromaTransform:

as.character, findFilesTodo, getAsteriskTags, getExpectedOutputFiles, getExpectedOutputFullnames, getFullName, getInputDataSet, getName, getOutputDataSet, getOutputDataSet0, getOutputFiles, getPath, getRootPath, getTags, isDone, process, setTags

Methods inherited from ParametersInterface:

getParameterSets, getParameters, getParametersAsString

Methods inherited from Object:

MatSmoothing

*The MatSmoothing class***Description**

Package: aroma.affymetrix

Class MatSmoothing**Object**

```

~~|
~~+--ParametersInterface
~~~~~|
~~~~~+--AromaTransform
~~~~~|
~~~~~+--Transform
~~~~~|
~~~~~+--ProbeLevelTransform
~~~~~|
~~~~~+--MatSmoothing

```

Directly known subclasses:

```

public static class MatSmoothing
extends ProbeLevelTransform

```

This class represents a function for smoothing data with a trimmed mean.

Usage

```
MatSmoothing(..., design=NULL, probeWindow=300, nProbes=10, meanTrim=0.1)
```

Arguments

| | |
|-------------|----------------------------------------------------------------------------------------------------------------|
| ... | Arguments passed to ProbeLevelTransform . |
| design | A design <i>matrix</i> . |
| probeWindow | Bandwidth to use. Effectively the width is 2*probeWindow since it looks probeWindow bases in either direction. |
| nProbes | The minimum number of probes to calculate a MAT score for. |
| meanTrim | The amount of trimming of the mean in [0,0.5]. |

Fields and Methods**Methods:**

process -

Methods inherited from ProbeLevelTransform:

getRootPath

Methods inherited from Transform:

Model

For a single unit group, the multiplicative model is:

$$y_{ik} = \theta_i \phi_k + \varepsilon_{ik}$$

where θ_i are the chip effects for arrays $i = 1, \dots, I$, and ϕ_k are the probe affinities for probes $k = 1, \dots, K$. The ε_{ik} are zero-mean noise with equal variance. To make parameters identifiable, the constraint $\prod_k \phi_k = 1$ is added.

public abstract static class **MultiArrayUnitModel**extends *UnitModel*

This abstract class represents a unit model that fits one model per unit based on signals for all arrays in the data set. The nature of a multi-array unit model is that all arrays must be available at the time of the fit and the estimated parameters will depend on the data from all arrays. Thus, if the signals in one array changes the model has to be refitted.

Usage

MultiArrayUnitModel(..., listOfPriors=NULL)

Arguments

... Arguments passed to *UnitModel*.

listOfPriors A *list* of priors to be used when fitting the model.

Fields and Methods

Methods:

```

getListOfPriors -
setListOfPriors -

```

Methods inherited from UnitModel:

findUnitsTodo, getAsteriskTags, getFitSingleCellUnitFunction, getParameters

Methods inherited from Model:

File format

The idea behind this class is store data fields which by nature have one value per probe (per field) in CEL files. A perfect example is to store probe-affinity estimates and their standard deviations. There is one probe affinity per probe so the structure of a CEL file (and its coupled CDF file) is well suited to read/write such information.

Consider a unit group with L probes. A CEL file stores intensities (L floats), stdvs (L floats), and pixels (L integers). Thus, for each probe $l=1, \dots, L$, a (float, float, integer) tuple is stored. We can use this for any information we want. If we want a slightly different structure, we can choose to encode/decode our structure/information to fit the structure of the CEL file. This abstract class provides transparent methods for encoding and decoding such information through methods `encodeUnitGroup()` and `decodeUnitGroup()`. By subclassing you can implement different types of data structures.

| | |
|-----------------|----------------------------------|
| ProbeLevelModel | <i>The ProbeLevelModel class</i> |
|-----------------|----------------------------------|

Description

Package: aroma.affymetrix

Class ProbeLevelModel

Object

```

~~|
~~+--ParametersInterface
~~~~~|
~~~~~+--Model
~~~~~|
~~~~~+--UnitModel
~~~~~|
~~~~~+--MultiArrayUnitModel
~~~~~|
~~~~~+--ProbeLevelModel

```

Directly known subclasses:

AffineCnPlm, AffinePlm, AffineSnpPlm, AvgCnPlm, AvgPlm, AvgSnpPlm, ExonRmaPlm, HetLogAddCnPlm, HetLogAddPlm, HetLogAddSnpPlm, MbeiCnPlm, MbeiPlm, MbeiSnpPlm, RmaCnPlm, RmaPlm, RmaSnpPlm

public abstract static class **ProbeLevelModel**

extends *MultiArrayUnitModel*

This abstract class represents a probe-level model (PLM) as defined by the **affyPLM** package: "A [...] PLM is a model that is fit to probe-intensity data. More specifically, it is where we fit a model

with probe level and chip level parameters on a probeset by probeset basis", where the more general case for a probeset is a *unit group* in Affymetrix CDF terms.

Usage

```
ProbeLevelModel(..., standardize=TRUE)
```

Arguments

... Arguments passed to `MultiArrayUnitModel`.

standardize If `TRUE`, chip-effect and probe-affinity estimates are rescaled such that the product of the probe affinities is one.

Details

In order to minimize the risk for mistakes, but also to be able compare results from different PLMs, all PLM subclasses must meet the following criteria:

1. All parameter estimates must be (stored and returned) on the intensity scale, e.g. log-additive models such as `RmaPlm` have to transform the parameters on the log-scale to the intensity scale.
2. The probe-affinity estimates ϕ_k for a unit group must be constrained such that $\prod_k \phi_k = 1$, or equivalently if $\phi_k > 0, \sum_k \log(\phi_k) = 0$.

Note that the above probe-affinity constraint guarantees that the estimated chip effects across models are on the same scale.

Fields and Methods

Methods:

```
fit -
getChipEffectSet -
getProbeAffinityFile -
getResidualSet -
getWeightsSet -
```

Methods inherited from `MultiArrayUnitModel`:

getListOfPriors, setListOfPriors, validate

Methods inherited from `UnitModel`:

findUnitsTodo, getAsteriskTags, getFitSingleCellUnitFunction, getParameters

Methods inherited from `Model`:

as.character, fit, getAlias, getAsteriskTags, getDataSet, getFullName, getName, getPath, getRootPath, getTags, setAlias, setTags

Methods inherited from `ParametersInterface`:

getParameterSets, getParameters, getParametersAsString

Methods inherited from `Object`:

\$, \$<-, [], [[<-, as.character, attach, attachLocally, clearCache, clearLookupCache, clone, detach, equals, extend, finalize, getEnvironment, getFieldModifier, getFieldModifiers, getFields, getInstantiationTime, getStaticInstance, hasField, hashCode, ll, load, names, objectSize, print, save, asThis

```

public abstract static class ProbeLevelTransform
extends Transform

```

This abstract class represents a transformation methods that transforms probe-level signals, typically intensities.

Usage

```

ProbeLevelTransform(...)

```

Arguments

... Arguments passed to the constructor of [Transform](#).

Details

Subclasses must implement the `process()` method.

Fields and Methods**Methods:**

No methods defined.

Methods inherited from Transform:

`getOutputDataSet`, `getOutputFiles`

Methods inherited from AromaTransform:

`as.character`, `findFilesTodo`, `getAsteriskTags`, `getExpectedOutputFiles`, `getExpectedOutputFullnames`, `getFullName`, `getInputDataSet`, `getName`, `getOutputDataSet`, `getOutputDataSet0`, `getOutputFiles`, `getPath`, `getRootPath`, `getTags`, `isDone`, `process`, `setTags`

Methods inherited from ParametersInterface:

`getParameterSets`, `getParameters`, `getParametersAsString`

Methods inherited from Object:

`$`, `$<-`, `[]`, `[[<-`, `as.character`, `attach`, `attachLocally`, `clearCache`, `clearLookupCache`, `clone`, `detach`, `equals`, `extend`, `finalize`, `getEnvironment`, `getFieldModifier`, `getFieldModifiers`, `getFields`, `getInstantiationTime`, `getStaticInstance`, `hasField`, `hashCode`, `ll`, `load`, `names`, `objectSize`, `print`, `save`, `asThis`

```

Directly known subclasses:

[AbstractProbeSequenceNormalization](#), [BaseCountNormalization](#), [BasePositionNormalization](#), [LinearModelProbeSequenceNormalization](#), [MatNormalization](#), [ScaleNormalization3](#), [UnitTypeScaleNormalization](#)

```

public abstract static class ProbeLevelTransform3
extends ProbeLevelTransform

```

This abstract class is specialized from [ProbeLevelTransform](#) and provides methods to identify subsets and types of probes that are used for fitting and/or updating the signals.

Usage

```

ProbeLevelTransform3(dataSet=NULL, ..., unitsToFit="-XY", typesToFit=typesToUpdate,
unitsToUpdate=NULL, typesToUpdate="pm", shift=0)

```

Arguments

| | |
|---------------|--------------------------------------------------------------------------------------------------------------|
| dataSet | A AffymetrixCelSet . |
| ... | Arguments passed to the constructor of ProbeLevelTransform . |
| unitsToFit | The units from which the normalization curve should be estimated. If <code>NULL</code> , all are considered. |
| typesToFit | Types of probes to be used when fitting the model. |
| unitsToUpdate | The units to be updated. If <code>NULL</code> , all are considered. |
| typesToUpdate | Types of probes to be updated. |
| shift | An optional amount to shift data before fitting and updating. |

Fields and Methods**Methods:**

No methods defined.

Methods inherited from ProbeLevelTransform:

getRootPath

Methods inherited from Transform:

getOutputDataSet, getOutputFiles

Methods inherited from AromaTransform:

as.character, findFilesTodo, getAsteriskTags, getExpectedOutputFiles, getExpectedOutputFullnames, getFullName, getInputDataSet, getName, getOutputDataSet, getOutputDataSet0, getOutputFiles, getPath, getRootPath, getTags, isDone, process, setTags

Methods inherited from ParametersInterface:

getParameterSets, getParameters, getParametersAsString

Methods inherited from Object:

~~~~~+--Transform
~~~~~|
~~~~~+--ProbeLevelTransform
~~~~~|
~~~~~+--QuantileNormalization

```

**Directly known subclasses:**

[DChipQuantileNormalization](#)

```
public static class QuantileNormalization
  extends ProbeLevelTransform
```

This class represents a normalization function that transforms the probe-level signals towards the same empirical distribution.

### Usage

```
QuantileNormalization(..., subsetToUpdate=NULL, typesToUpdate=NULL,
  targetDistribution=NULL, subsetToAvg=subsetToUpdate, typesToAvg=typesToUpdate)
```

### Arguments

|                    |                                                                                                                                                                                                    |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ...                | Arguments passed to the constructor of <i>ProbeLevelTransform</i> .                                                                                                                                |
| subsetToUpdate     | The probes to be updated. If <code>NULL</code> , all probes are updated.                                                                                                                           |
| typesToUpdate      | Types of probes to be updated.                                                                                                                                                                     |
| targetDistribution | A <b>numeric vector</b> . The empirical distribution to which all arrays should be normalized to.                                                                                                  |
| subsetToAvg        | The probes to calculate average empirical distribution over. If a single <b>numeric</b> in (0,1), then this fraction of all probes will be used. If <code>NULL</code> , all probes are considered. |
| typesToAvg         | Types of probes to be used when calculating the average empirical distribution. If "pm" and "mm" only perfect-match and mismatch probes are used, respectively. If "pmm" both types are used.      |

ReseqCrosstalkCalibration

*The ReseqCrosstalkCalibration class*

---

### Description

Package: aroma.affymetrix

**Class ReseqCrosstalkCalibration**

```

Object
~~|
~~+---ParametersInterface
~~~~~|
~~~~~+---AromaTransform
~~~~~|
~~~~~+---Transform
~~~~~|
~~~~~+---ProbeLevelTransform
~~~~~|
~~~~~+---ReseqCrosstalkCalibration

```

### Directly known subclasses:

```

public static class ReseqCrosstalkCalibration
extends ProbeLevelTransform

```

This class represents a calibration function that transforms the probe-level signals such that the signals from the four nucleotides (A, C, G, T) are orthogonal.

### Usage

```

ReseqCrosstalkCalibration(dataSet=NULL, ..., targetAvg=2200, subsetToAvg=NULL,
mergeGroups=FALSE, flavor=c("sfit", "expectile"), alpha=c(0.1, 0.075, 0.05, 0.03,
0.01), q=2, Q=98)

```

### Arguments

|             |                                                                                                                                                                                        |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dataSet     | An <i>AffymetrixCelSet</i> .                                                                                                                                                           |
| ...         | Arguments passed to the constructor of <i>ProbeLevelTransform</i> .                                                                                                                    |
| targetAvg   | The signal(s) that the average of the sum of the probe quartets should have after calibration.                                                                                         |
| subsetToAvg | The indices of the cells (taken as the intersect of existing indices) used to calculate average in order to rescale to the target average. If <i>NULL</i> , all probes are considered. |
| mergeGroups | A <i>logical</i> ...                                                                                                                                                                   |
| flavor      | A <i>character</i> string specifying what algorithm is used to fit the crosstalk calibration.                                                                                          |
| alpha, q, Q | Additional arguments passed to <i>fitMultiDimensionalCone()</i> .                                                                                                                      |

RmaBackgroundCorrection

*The RmaBackgroundCorrection class*

---

**Description**

Package: aroma.affymetrix

**Class RmaBackgroundCorrection****Object**

```

~|
~+--ParametersInterface
~~~~~|
~~~~~+--AromaTransform
~~~~~|
~~~~~+--Transform
~~~~~|
~~~~~+--ProbeLevelTransform
~~~~~|
~~~~~+--BackgroundCorrection
~~~~~|
~~~~~+--RmaBackgroundCorrection

```

**Directly known subclasses:**

public static class **RmaBackgroundCorrection**  
 extends [BackgroundCorrection](#)

This class represents the RMA background adjustment function.

**Usage**

```
RmaBackgroundCorrection(..., addJitter=FALSE, jitterSd=0.2, seed=6022007)
```

**Arguments**

|           |                                                                                                      |
|-----------|------------------------------------------------------------------------------------------------------|
| ...       | Arguments passed to the constructor of <a href="#">BackgroundCorrection</a> .                        |
| addJitter | If <b>TRUE</b> , Zero-mean gaussian noise is added to the signals before being background corrected. |
| jitterSd  | Standard deviation of the jitter noise added.                                                        |

seed            An (optional) [integer](#) specifying a temporary random seed to be used for generating the (optional) jitter. The random seed is set to its original state when done. If [NULL](#), it is not set.

### Details

Internally [bg.adjust](#) is used to background correct the probe signals. The default is to background correct PM signals only.

### Fields and Methods

#### Methods:

process -

#### Methods inherited from BackgroundCorrection:

getParameters, process

#### Methods inherited from ProbeLevelTransform:

getRootPath

#### Methods inherited from Transform:

getOutputDataSet, getOutputFiles

#### Methods inherited from AromaTransform:

as.character, findFilesTodo, getAsteriskTags, getExpectedOutputFiles, getExpectedOutputFullNames, getFullName, getInputDataSet, getName, getOutputDataSet, getOutputDataSet0, getOutputFiles, getPath, getRootPath, getTags, isDone, process, setTags

#### Methods inherited from ParametersInterface:

getParameterSets, getParameters, getParametersAsString

#### Methods inherited from Object:

\$, \$<-, [], [[<-, as.character, attach, attachLocally, clearCache, clearLookupCache, clone, detach, equals, extend, finalize, getEnvironment, getFieldModifier, getFieldModifiers, getFields, getInstantiationTime, getStaticInstance, hasField, hashCode, ll, load, names, objectSize, print, save, asThis

### Jitter noise

The fitting algorithm of the RMA background correction model may not converge if there too many small and discrete signals. To overcome this problem, a small amount of noise may be added to the signals before fitting the model. This is an ad hoc solution that seems to work. However, add Gaussian noise may generate non-positive signals.

~~~~~+--Model
~~~~~|
~~~~~+--UnitModel
~~~~~|
~~~~~+--MultiArrayUnitModel
~~~~~|
~~~~~+--ProbeLevelModel
~~~~~|
~~~~~+--RmaPlm

```

**Directly known subclasses:**

*ExonRmaPlm, HetLogAddCnPlm, HetLogAddPlm, HetLogAddSnpPlm, RmaCnPlm, RmaSnpPlm*

```

public abstract static class RmaPlm
extends ProbeLevelModel

```

This class represents the log-additive model part of the Robust Multichip Analysis (RMA) method described in Irizarry et al (2003).

**Usage**

```
RmaPlm(..., flavor=c("affyPLM", "oligo"))
```

**Arguments**

|        |                                                                                                                                                          |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| ...    | Arguments passed to <code>ProbeLevelModel</code> .                                                                                                       |
| flavor | A <code>character</code> string specifying what model fitting algorithm to be used. This makes it possible to get identical estimates as other packages. |

**Fields and Methods****Methods:**

*No methods defined.*

**Methods inherited from ProbeLevelModel:**

calculateResidualSet, calculateWeights, fit, getAsteriskTags, getCalculateResidualsFunction, getChipEffectSet, getProbeAffinityFile, getResidualSet, getRootPath, getWeightsSet

**Methods inherited from MultiArrayUnitModel:**

getListOfPriors, setListOfPriors, validate

**Methods inherited from UnitModel:**

findUnitsTodo, getAsteriskTags, getFitSingleCellUnitFunction, getParameters

**Methods inherited from Model:**

as.character, fit, getAlias, getAsteriskTags, getDataSet, getFullName, getName, getPath, getRootPath, getTags, setAlias, setTags

**Methods inherited from ParametersInterface:**

getParameterSets, getParameters, getParametersAsString

**Methods inherited from Object:**

\$. \$<-, [[, [[<-, as.character, attach, attachLocally, clearCache, clearLookupCache, clone, detach, equals, extend, finalize, getEnvironment, getFieldModifier, getFieldModifiers, getFields, getInstantiationTime, getStaticInstance, hasField, hashCode, ll, load, names, objectSize, print, save, asThis

**Model**

For a single unit group, the log-additive model of RMA is:

$$\log_2(y_{ik}) = \beta_i + \alpha_k + \varepsilon_{ik}$$

where  $\beta_i$  are the chip effects for arrays  $i = 1, \dots, I$ , and  $\alpha_k$  are the probe affinities for probes  $k = 1, \dots, K$ . The  $\varepsilon_{ik}$  are zero-mean noise with equal variance. The model is constrained such that  $\sum_k \alpha_k = 0$ .

Note that all PLM classes must return parameters on the intensity scale. For this class that means that  $\theta_i = 2^{\beta_i}$  and  $\phi_k = 2^{\alpha_k}$  are returned.

**Different flavors of model fitting**

There are a few differ algorithms available for fitting the same probe-level model. The default and recommended method (flavor="affyPLM") uses the implementation in the **preprocessCore** package which fits the model parameters robustly using an M-estimator (the method used to be in **affyPLM**).

Alternatively, other model-fitting algorithms are available. The algorithm (flavor="oligo") used by the **oligo** package, which originates from the **affy** packages, fits the model using median polish, which is a non-robust estimator. Note that this algorithm does not constraint the probe-effect parameters to multiply to one on the intensity scale. Since the internal function does not return these estimates, we can neither rescale them.

ScaleNormalization      *The ScaleNormalization class*

---

**Description**

Package: aroma.affymetrix

**Class ScaleNormalization****Object**

```

~~|
~~+--ParametersInterface
~~~~~|
~~~~~+--AromaTransform
~~~~~|
~~~~~+--Transform

```

```

~~~~~|
~~~~~+---ProbeLevelTransform
~~~~~|
~~~~~+---ScaleNormalization

```

### Directly known subclasses:

```

public static class ScaleNormalization
extends ProbeLevelTransform

```

This class represents a normalization function that transforms the probe-level signals towards the same scale.

### Usage

```

ScaleNormalization(dataSet=NULL, ..., targetAvg=4400, subsetToUpdate=NULL,
typesToUpdate=NULL, subsetToAvg="-XY", typesToAvg=typesToUpdate, shift=0)

```

### Arguments

|                |                                                                                                                                                                                             |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dataSet        | <a href="#">AffymetrixCelSet</a> to be normalized.                                                                                                                                          |
| ...            | Arguments passed to the constructor of <a href="#">ProbeLevelTransform</a> .                                                                                                                |
| targetAvg      | A <a href="#">numeric</a> value.                                                                                                                                                            |
| subsetToUpdate | The probes to be updated. If <code>NULL</code> , all probes are updated.                                                                                                                    |
| typesToUpdate  | Types of probes to be updated.                                                                                                                                                              |
| subsetToAvg    | The probes to calculate average signal over. If a single <a href="#">numeric</a> in (0,1), then this fraction of all probes will be used. If <code>NULL</code> , all probes are considered. |
| typesToAvg     | Types of probes to be used when calculating the average signal. If "pm" and "mm" only perfect-match and mismatch probes are used, respectively. If "pmmm" both types are used.              |
| shift          | Optional amount of shift if data before fitting/normalizing.                                                                                                                                |

~~~~~+--ProbeLevelTransform3
~~~~~|
~~~~~+--ScaleNormalization3

```

**Directly known subclasses:**

```
public static class ScaleNormalization3
```

```
extends ProbeLevelTransform3
```

This class represents a normalization function that transforms the probe-level signals towards the same scale.

**Usage**

```
ScaleNormalization3(..., targetAvg=4400)
```

**Arguments**

... Arguments passed to the constructor of `ProbeLevelTransform3`.  
 targetAvg A numeric value.

**Fields and Methods****Methods:**

process -

**Methods inherited from ProbeLevelTransform3:**

getAsteriskTags, getCellsTo, getCellsToFit, getCellsToUpdate, getParameters, getUnitsTo, getUnitsToFit, getUnitsToUpdate, writeSignals

**Methods inherited from ProbeLevelTransform:**

getRootPath

**Methods inherited from Transform:**

getOutputDataSet, getOutputFiles

**Methods inherited from AromaTransform:**

as.character, findFilesTodo, getAsteriskTags, getExpectedOutputFiles, getExpectedOutputFullnames, getFullName, getInputDataSet, getName, getOutputDataSet, getOutputDataSet0, getOutputFiles, getPath, getRootPath, getTags, isDone, process, setTags

SmoothMultiarrayModel *The SmoothMultiarrayModel class*

---

**Description**

Package: aroma.affymetrix

**Class SmoothMultiarrayModel****Object**

```

~~|
~~+--ChromosomalModel
~~~~~|
~~~~~+--SmoothMultiarrayModel

```

**Directly known subclasses:**

*SmoothRmaModel*, *SmoothSaModel*

public abstract static class **SmoothMultiarrayModel**  
 extends *ChromosomalModel*

This abstract class represents a chromosomal smoothing method done chromosome by chromosome.

**Usage**

```
SmoothMultiarrayModel(..., typeOfWeights=c("none", "1/s2"), bandwidth=10000, tags="*")
```

**Arguments**

|               |                                                                                     |
|---------------|-------------------------------------------------------------------------------------|
| ...           | Arguments passed to the constructor of <i>ChromosomalModel</i> .                    |
| typeOfWeights | A <b>character</b> string.                                                          |
| bandwidth     | A single <b>numeric</b> specifying the smoothing bandwidth in units of nucleotides. |
| tags          | A <b>character vector</b> of tags to be added.                                      |

**Fields and Methods****Methods:**

```

getBandwidth -
getOutputTuple -
setBandwidth -

```

**Methods inherited from ChromosomalModel:**

as.character, fit, getAlias, getAromaGenomeTextFile, getAsteriskTags, getChipType, getChipTypes, getChromosomes, getFullName, getFullNames, getGenome, getGenomeData, getGenomeFile, getListOfAromaUgpFiles, getName, getNames, getParentPath, getPath, getReportPath, getRootPath, getSetTuple, getSets, getTags, indexOf, nbrOfArrays, nbrOfChipTypes, setChromosomes, setGenome, getListOfGenomeInformations, getPcuTheta, getPositionChipTypeUnit

SnpPlm

The SnpPlm interface class

Description

Package: aroma.affymetrix

Class SnpPlm

Interface

```
~~|
~~+--SnpPlm
```

Directly known subclasses:

AffineCnPlm, AffineSnpPlm, AvgCnPlm, AvgSnpPlm, CnPlm, HetLogAddCnPlm, HetLogAddSnpPlm, MbeiCnPlm, MbeiSnpPlm, RmaCnPlm, RmaSnpPlm

```
public class SnpPlm
```

```
extends Interface
```

An [Interface](#) implementing methods special for [ProbeLevelModels](#) specific to SNP arrays.

Usage

```
SnpPlm(...)
```

Arguments

```
...          Not used.
```

Methods**Methods:**

```

getCellIndices      -
getChipEffectSet    -
getMergeStrands     -
getProbeAffinityFile -
setMergeStrands     -

```

Methods inherited from Interface:

extend, print, uses

Requirements

Classes inheriting from this [Interface](#) must provide the following fields:

- mergeStrandsA [logical](#) value indicating if strands should be merged or not.

Author(s)

Henrik Bengtsson

Examples

```

for (zzz in 0) {

# Setup verbose output
verbose <- Arguments$getVerbose(-2)
timestampOn(verbose)

# -----
# Define an example dataset using this path
# -----
# Find any SNP dataset
path <- NULL
if (is.null(path))
  break

if (!exists("ds")) {
  ds <- AffymetrixCelSet$fromFiles(path)
}
print(ds)

# -----
# Create a set of various PLMs for this dataset
# -----
if (!exists("models", mode="list")) {
  mergeStrands <- TRUE
  models <- list(
    rma = RmaSnpPlm(ds, mergeStrands=mergeStrands),
    mbei = MbeiSnpPlm(ds, mergeStrands=mergeStrands)
  # affine = AffineSnpPlm(ds, background=FALSE, mergeStrands=mergeStrands)
  )
}
}

```

```

}
print(models)

# -----
# For each model, fit a few units
#
# Note, by fitting the same set of units across models, the internal
# caching mechanisms of aroma.affymetrix makes sure that the data is
# only read into memory once. See log for reading speed.
# -----
units <- 55+1:100

for (model in models) {
  ruler(verbose)
  fit(model, units=units, force=TRUE, verbose=verbose)
}

# -----
# For each unit, plot the estimated (thetaB,thetaA) for all models
# -----
# Should we plot the on the log scale?
log <- TRUE

# Do only user to press ENTER if more than one unit is plotted
opar <- par(ask=(length(units) > 1))

Alab <- expression(theta[A])
Blab <- expression(theta[B])
if (log) {
  lim <- c(6, 16)
} else {
  lim <- c(0, 2^15)
}

# For each unit...
for (unit in units) {
  # For all models...
  for (kk in seq_along(models)) {
    ces <- getChipEffects(models[[kk]])
    ceUnit <- ces[unit]
    snpName <- names(ceUnit)[1]
    theta <- ceUnit[[1]]
    thetaA <- theta[[1]]$theta
    thetaB <- theta[[2]]$theta
    if (log) {
      thetaA <- log(thetaA, base=2)
      thetaB <- log(thetaB, base=2)
    }

    # Create the plot?
    if (kk == 1) {
      plot(NA, xlim=lim, ylim=lim, xlab=Blab, ylab=Alab, main=snpName)
    }
  }
}

```

```

    abline(a=0, b=1, lty=2)
  }

  # Plot the estimated parameters
  points(thetaB, thetaA, col=kk, pch=19)
}
} # for (unit ...)

# Reset graphical parameter settings
par(opar)

} # for (zzz in 0)
rm(zzz)

```

SnpProbeAffinityFile *The SnpProbeAffinityFile class*

Description

Package: aroma.affymetrix
Class SnpProbeAffinityFile

SpatialReporter

The SpatialReporter class

Description

Package: aroma.affymetrix

Class SpatialReporter

Object

```

~~|
~~+--GenericReporter
~~~~~|
~~~~~+--AffymetrixFileSetReporter
~~~~~|
~~~~~+--AffymetrixCelSetReporter
~~~~~|
~~~~~+--SpatialReporter

```

Directly known subclasses:

public abstract static class **SpatialReporter**
 extends *AffymetrixCelSetReporter*

A SpatialReporter generates image files of spatial representations of cell signals for each of the arrays in the input set.

Usage

```
SpatialReporter(..., reference=NULL)
```

Arguments

... Arguments passed to [AffymetrixCelSetReporter](#).
reference An optional reference [AffymetrixCelFile](#).

Fields and Methods

Methods:

```
addColorMap -
getColorMaps -
plotMargins -
process -
setColorMaps -
```

Methods inherited from AffymetrixCelSetReporter:

as.character, getChipType, getDataSet, getPath, nbrOfArrays

Methods inherited from AffymetrixFileSetReporter:

getFileSet, getInputName, getInputTags

Methods inherited from GenericReporter:

as.character, getAlias, getAsteriskTags, getFullName, getInputName, getInputTags, getMainPath, getName, getPath, getReportSet, getRootPath, getTags, process, setAlias, setup

Methods inherited from Object:

\$, \$<-, [[, [[<-, as.character, attach, attachLocally, clearCache, clearLookupCache, clone, detach, equals, extend, finalize, getEnvironment, getFieldModifier, getFieldModifiers, getFields, getInstantiationTime, getStaticInstance, hasField, hashCode, ll, load, names, objectSize, print, save, asThis

Author(s)

Henrik Bengtsson

Description

Package: aroma.affymetrix

Class TransformReport**Object**

~~|

~~+--TransformReport

Directly known subclasses:

public static class **TransformReport**

extends [Object](#)

Usage

TransformReport(inSet=NULL, outSet=NULL, ...)

Arguments

| | |
|--------|--------------------------------------------------------------|
| inSet | The input data set as an AffymetrixCelSet . |
| outSet | The output data set as an AffymetrixCelSet . |
| ... | Not used. |

Fields and Methods**Methods:**

| | |
|--------------------|---|
| getCdf | - |
| getFullName | - |
| getInputDataSet | - |
| getName | - |
| getOutputDataSet | - |
| getPath | - |
| getTags | - |
| getUnitNamesFile | - |
| getUnitTypesFile | - |
| getYY | - |
| nbrOfArrays | - |
| plotXYCurve | - |
| plotXYCurveLog2 | - |
| seq | - |
| writeImageCombined | - |
| writeImages | - |

Methods inherited from Object:

\$, \$<-, [], []<-, as.character, attach, attachLocally, clearCache, clearLookupCache, clone, detach, equals, extend, finalize, getEnvironment, getFieldModifier, getFieldModifiers, getFields, getInstantiationTime, getStaticInstance, hasField, hashCode, ll, load, names, objectSize, print, save, asThis

UgpGenomeInformation *The UgpGenomeInformation class*

Description

Package: aroma.affymetrix

Class UgpGenomeInformation**Object**

```

~~|
~~+--FullNameInterface
~~~~~|
~~~~~+--GenericDataFile
~~~~~|
~~~~~+--CacheKeyInterface
~~~~~|
~~~~~+--FileCacheKeyInterface
~~~~~|
~~~~~+--GenomeInformation
~~~~~|
~~~~~+--UgpGenomeInformation

```

Directly known subclasses:

```

public abstract static class UgpGenomeInformation
extends GenomeInformation

```

This class represents Aroma UGP genome information files.

Usage

```

UgpGenomeInformation(..., .ugp=NULL, .verify=TRUE)

```

Arguments

| | |
|---------|---------------------------------------------------------|
| ... | Arguments passed to GenomeInformation . |
| .ugp | For internal use only. |
| .verify | For internal use only. |

Fields and Methods**Methods:**

| | |
|----------------------|---|
| byChipType | - |
| getChipType | - |
| getChromosomes | - |
| getData | - |
| getUnitsOnChromosome | - |
| isCompatibleWithCdf | - |
| nbrOfUnits | - |
| readDataFrame | - |

Methods inherited from GenomeInformation:

as.character, byChipType, fromCdf, fromDataSet, getChipType, getChromosomeStats, getChromosomes, getData, getPositions, getUnitIndices, getUnitsOnChromosome, getUnitsOnChromosomes, isCompatibleWithCdf, nbrOfUnits, plotDensity, readDataFrame, verify

Methods inherited from FileCacheKeyInterface:

getCacheKey

Methods inherited from CacheKeyInterface:

UnitModel

The UnitModel class

Description

Package: aroma.affymetrix

Class UnitModel

Object

```

~|
~+---ParametersInterface
~~~~~|
~~~~~+---Model
~~~~~|
~~~~~+---UnitModel

```

Directly known subclasses:

AffineCnPlm, AffinePlm, AffineSnpPlm, AlleleSummation, AvgCnPlm, AvgPlm, AvgSnpPlm, ExonRmaPlm, FirmaModel, HetLogAddCnPlm, HetLogAddPlm, HetLogAddSnpPlm, MbeiCnPlm, MbeiPlm, MbeiSnpPlm, MultiArrayUnitModel, ProbeLevelModel, RmaCnPlm, RmaPlm, RmaSnpPlm, SingleArrayUnitModel

```

public abstract static class UnitModel
extends Model

```

This class is abstract and represents a generic unit model, i.e. a model that is applied to each unit separately.

Usage

```

UnitModel(dataSet=NULL, probeModel=c("pm", "mm", "pm-mm", "min1(pm-mm)", "pm+mm"),
  shift=0, ...)

```

Arguments

dataSet An [AffymetrixCelSet](#) to which this model should be fitted.

probeModel A [character](#) string specifying how PM and MM values should be modeled. By default only PM signals are used.

shift An optional amount the signals should be shifted (translated) before fitting the model.

... Arguments passed to the constructor of [Model](#).

Fields and Methods

Methods:

findUnitsTodo -

Methods inherited from Model:

as.character, fit, getAlias, getAsteriskTags, getDataSet, getFullName, getName, getPath, getRootPath, getTags, setAlias, setTags

Methods inherited from ParametersInterface:

getParameterSets, getParameters, getParametersAsString

Methods inherited from Object:

\$, \$<-, [], [[<-, as.character, attach, attachLocally, clearCache, clearLookupCache, clone, detach, equals, extend, finalize, getEnvironment, getFieldModifier, getFieldModifiers, getFields, getInstantiationTime, getStaticInstance, hasField, hashCode, ll, load, names, objectSize, print, save, asThis

UnitTypeScaleNormalization

The UnitTypeScaleNormalization class

Description

Package: aroma.affymetrix

Class UnitTypeScaleNormalization

Object

```

~~|
~~+--ParametersInterface
~~~~~|
~~~~~+--AromaTransform
~~~~~|
~~~~~+--Transform
~~~~~|
~~~~~+--ProbeLevelTransform
~~~~~|

```

```

~~~~~+---ProbeLevelTransform3
~~~~~|
~~~~~+---UnitTypeScaleNormalization

```

Directly known subclasses:

```

public static class UnitTypeScaleNormalization
extends ProbeLevelTransform3

```

This class represents a normalization function that transforms the probe signals such that each unit type gets the same average.

Usage

```
UnitTypeScaleNormalization(..., targetAvg=4400)
```

Arguments

```

...           Arguments passed to the constructor of ProbeLevelTransform3.
targetAvg     A numeric value.

```

Fields and Methods

Methods:

```
process -
```

Methods inherited from *ProbeLevelTransform3*:

```
getAsteriskTags, getCellsTo, getCellsToFit, getCellsToUpdate, getParameters, getUnitsTo, getUnitsToFit, getUnitsToUpdate, writeSignals
```

Methods inherited from *ProbeLevelTransform*:

```
getRootPath
```

Methods inherited from *Transform*:

```
getOutputDataSet, getOutputFiles
```

Methods inherited from *AromaTransform*:

```
as.character, findFilesTodo, getAsteriskTags, getExpectedOutputFiles, getExpectedOutputFullnames, getFullName, getInputDataSet, getName, getOutputDataSet, getOutputDataSet0, getOutputFiles, getPath, getRootPath, getTags, isDone, process, setTags
```

Methods inherited from *ParametersInterface*:

```
getParameterSets, getParameters, getParametersAsString
```

Methods inherited from *Object*:

```
$, $<-, [], [[<-, as.character, attach, attachLocally, clearCache, clearLookupCache, clone, detach, equals, extend, finalize, getEnvironment, getFieldModifier, getFieldModifiers, getFields, getInstantiationTime, getStaticInstance, hasField, hashCode, ll, load, names, objectSize, print, save, asThis
```

~~~~~|
~~~~~+--AffymetrixCelFile
~~~~~|
~~~~~+--ParametersInterface
~~~~~|
~~~~~+--ParameterCelFile
~~~~~|
~~~~~+--WeightsFile

```

Directly known subclasses:

```

public abstract static class WeightsFile
extends ParameterCelFile

```

This class represents weights calculated from residuals of probe-level models.

Usage

```

WeightsFile(..., probeModel=c("pm"))

```

Arguments

... Arguments passed to [ParameterCelFile](#).
 probeModel The specific type of model, e.g. "pm".

Fields and Methods**Methods:**

```

findUnitsTodo -
getImage      -
readUnits     -
writeImage    -

```

Methods inherited from ParameterCelFile:

extractDataFrame, extractMatrix, readUnits

Methods inherited from ParametersInterface:

getParameterSets, getParameters, getParametersAsString

Methods inherited from AffymetrixCelFile:

allocateFromCdf, as.character, clone, createFrom, extractMatrix, fromFile, getAm, getCdf, getExtensionPattern, getFileFormat, getImage, getUnitNamesFile, getUnitTypesFile, highlight, image270, nbrOfCells, plotDensity, plotImage, plotMvsA, plotMvsX, range, setCdf, smoothScatterMvsA, writeImage

Methods inherited from AromaPlatformInterface:

getAromaPlatform, getAromaUflFile, getAromaUgpFile, getChipType, getPlatform, getUnitAnnotationDataFile, getUnitNamesFile, getUnitTypesFile, isCompatibleWith

Methods inherited from AromaMicroarrayDataFile:

getAttributeXY, getChipType, getPlatform, getPloidy, getXAM, hasAttributeXY, isAverageFile, setAttributeXY, setAttributesByTags

Methods inherited from FileCacheKeyInterface:

getCacheKey

Methods inherited from CacheKeyInterface:

getCacheKey
