Package 'behaviorchange'

October 12, 2022

Type Package **Title** Tools for Behavior Change Researchers and Professionals Version 0.5.1 Maintainer Gjalt-Jorn Peters <gjalt-jorn@behaviorchange.eu> **License** GPL (>= 3) **Description** Contains specialised analyses and visualisation tools for behavior change science. These facilitate conducting determinant studies (for example, using confidence interval-based estimation of relevance, CIBER, or CIBERlite plots, see Crutzen, Noijen & Peters (2017) <doi:10.3389/fpubh.2017.00165>), systematically developing, reporting, and analysing interventions (for example, using Acyclic Behavior Change Diagrams), and reporting about intervention effectiveness (for example, using the Numbers Needed for Change, see Gruijters & Peters (2017) <doi:10.31234/osf.io/2bau7>), and computing the required sample size (using the Meaningful Change Definition, see Gruijters & Peters (2020) <doi:10.1080/08870446.2020.1841762>). This package is especially useful for researchers in the field of behavior change or health psychology and to behavior change professionals such as intervention developers and prevention workers. Acyclic Behavior Change Diagram

Description

This function generates an acyclic behavior change diagram (ABCD) from a specification in a google sheet or .csv file. An ABCD is a logic model that illustrates the assumptions underlying a behavior change intervention. Specifically, the ABCD shows the assumed causal and structural assumptions, thereby showing what is assumed to cause what (e.g. which elements of the intervention are assumed to influence which aspects of the target population's psychology?) and what is assumed to consist of what (e.g. which determinants are assumed to contain which specific aspects of the target population's psychology?).

Usage

```
abcd(
  specs,
  specCols = c("bcps", "cnds", "apps", "sdts", "dets", "pobs", "behs"),
  localBackup = NULL,
  title = "Acyclic Behavior Change Diagram\n\n",
  outputFile = NULL,
  outputWidth = 3000,
  outputHeight = 1500,
  includeColNames = TRUE,
  maxLabelLength = 30,
  nodeFontSize = 10,
  edgeFontSize = 8,
  colNameFontSize = nodeFontSize,
  grayscale = FALSE,
  colorTheme = behaviorchange::opts$get("aabbcc"),
  penWidth = 1,
  silent = FALSE,
  returnGraphOnly = FALSE,
  returnSvgOnly = FALSE,
  columnWarning = TRUE,
  graphTheme = list(c("fontname", "Arial", "node")),
  regExReplacements = behaviorchange::opts$get("diagrammerSanitization")
)
## S3 method for class 'abcdiagram'
print(
  Х,
 width = x$input$width,
 height = x$input$height,
 title = DiagrammeR::get_graph_name(x$output$graph),
)
```

Arguments

specs

The specifications: either a google sheets URL, the path to a local file, a character vector with both, or a matrix or data frame

specCols

The order of the columns. This character vector specified the order of the elements of an ABCD. In the default order, from left to right, these are (see below for definitions and more details):

- bcps = Behavior Change Principles (BCPs);
- cnds = Conditions for effectiveness;
- apps = **Applications**;
- sdts = **Sub-determinants**;
- dets = **Determinants**:
- pobs = **Performance Objectives**;
- behs = **Behaviors**:

localBackup

Whether to write the specifications to a local backup

title

The title of the diagram

outputFile If specified, the ABCD is written to this file using DiagrammeR::export graph. outputWidth, outputHeight

If an outputFile is specified, these determine its width and height (in pixels)

includeColNames

Whether to include the column names as titles/legend for the entities in each 'column' of the ABCD.

maxLabelLength At which width to word wrap the labels.

nodeFontSize, edgeFontSize, colNameFontSize

Font sizes of the nodes (i.e. the text in boxes), edges (basically the conditions

for effectiveness) and the column names (at the bottom).

grayscale

Whether to use the colorTheme or produce a grayscale ABCD.

colorTheme

The color theme, a named list containing the colors, each a character vector with three HTML (hex) color values. The list elements have to be named bcp, condition_for_effectiveness, application, sub_determinant, determinant, sub_behavior, and target_behavior, and each must contain a named vector with two elements named fill, stroke, and text, containing the color codes for the fill, stroke, and text, respectively; see behaviorchange::opts\$get("aabbcc")

for an example.

The width of the pen to draw the strokes. penWidth

Whether to suppress (TRUE) or show (FALSE) more detailed information. silent

returnGraphOnly, returnSvgOnly

Whether to return the full results object or only either the DiagrammeR::DiagrammeR graph or a one-value character vector containing a Scalable Vector Graphic as produced by DiagrammeRsvg::export_svg().

columnWarning

Can be used to suppress the warning if the number of columns is too large.

graphTheme

Specific settings to apply to the graph using apply_graph_theme(); a list of vectors, where each vector has three elements: the setting, the value, and what to apply it to ('node', 'edge', or 'graph').

regExReplacements

A list of pairs of regular expressions that will be applied to the specifications before generating the ABCD. This can be used to sanitize problematic characters (e.g. ', " and \).

x The ABCD object to print (as generated by a call to abcd).

width, height Width and height to use when printing the ABCD.

.. Any additional arguments are passed on to DiagrammeR::render_graph().

Details

Specifically, a full ABCD is a model that shows the following elements:

- Behavior Change Principles (BCPs): The specific psychological principles engaged to influence the relevant sub-determinants, usually selected using the determinants to which the sub-determinants 'belong'. These are also known as methods of behavior change in the Intervention Mapping framework, or behavior change techniques, BCTs, in the Behavior Change Wheel approach. For a list of 99 BCPs, see Kok et al. (2016).
- Conditions for effectiveness: The conditions that need to be met for a Behavior Change Principle (BCP) to be effective. These conditions depend on the specific underlying Evolutionary Learning Processes (ELPs) that the BCP engages (Crutzen & Peters, 2018). If the conditions for effectiveness (called *parameters* for effectiveness in the Intervention Mapping framework) are not met, the method will likely not be effective, or at least, not achieve its maximum effectiveness.
- **Applications**: Since BCP's describe aspects of human psychology in general, they are necessarily formulated on a generic level. Therefore, using them in an intervention requires translating them to the specific target population, culture, available means, and context. The result of this translation is the application of the BCP. Multiple BCPs can be combined into one application; and one BCP can be applied in multiple applications (see Kok, 2014).
- **Sub-determinants**: Behavior change interventions engage specific aspects of the human psychology (ideally, they specifically, target those aspects found most important in predicting the target behavior, as can be established with CIBER plots. These aspects are called sub-determinants (the Intervention Mapping framework references *Change Objectives*, which are sub-determinants formulated according to specific guidelines). In some theoretical traditions, sub-determinants are called *beliefs*.
- **Determinants**: The overarching psychological constructs that are defined as clusters of specific aspects of the human psychology that explain humans' behavior (and are targeted by behavior change interventions). Psychological theories contain specific definitions of such determinants, and make statements about how they relate to each other and to human behavior. There are also theories (and exists empirical evidence) on how these determinants can be changed (i.e. BCPs), so althought the sub-determinants are what is targeted in an intervention, the selection of feasible BCPs requires knowing to which determinants those sub-determinants belong.
- **Performance objectives**: The specific sub-behaviors that often underlie (or make up) the ultimate target behavior. These are distinguished from the overarching target behavior because the relevant determinants of these sub-behaviors can be different: for example, the reasons why people do or do not *buy* condoms can be very different from the reasons why they do or do not *carry* condoms or why they do or do not *negotiate* condom use with a sexual partner.

• **Behavior**: The ultimate target behavior of the intervention, usually an umbrella that implicitly contains multiple performance objectives.

For details, see Peters et al. (2019).

Value

A list consisting of an input, intermediate, and output list, where the ABCD is stored in the output list as a DiagrammeR::DiagrammeR called graph.

Author(s)

Gjalt-Jorn Peters, <gjalt-jorn@a-bc.eu>, with contributions from Matti Heino and Sander Eggers.

```
### Load one of the ABCD matrices supplied
### with the behaviorchange package
data(abcd_specification_example_xtc);
### Create ABCD matrix (using 'print' to allow pkgdown() to print properly).
print(behaviorchange::abcd(abcd_specification_example_xtc));
### Other examples not executed during testing as creating ABCDs takes long
## Not run:
### Change the appearance; note that many attributes are specified
### for specific elements, and element-level settings always override
### the global settings that can be specified here.
print(
 behaviorchange::abcd(
   abcd_specification_example_xtc,
   graphTheme = list(
     c("fontname", "Courier New", "node")
 )
```

```
abcd_specs_examples 7
);
## End(Not run)

abcd_specs_examples Simple example datasets for ABCDs
```

Description

This are three (nested) datasets illustrating the logic model of change for a simple condom use intervention in a way that can be visualised using the abcd function. The full dataset is abcd_specs_full, a subset that does not explicitly include the conditions for effectiveness (instead showing letters that can then be explained in, for example, the manuscript text) is called abcd_specs_without_conditions, and a version that only contains the information about one sub-behavior (performance objective) is available as abcd_specs_single_po_without_conditions. The variables in the full dataset are:

Usage

```
data(abcd_specs_complete)

data(abcd_specs_without_conditions)

data(abcd_specs_single_po_without_conditions)

data(abcd_specification_example_xtc)

data(abcd_specs_dutch_xtc)

data(abcd_specification_empty)
```

Format

For abcd_specs_complete, a data frame with 7 variables and 7 rows; for abcd_specs_without_conditions, a data frame with 6 variables and 7 rows; for abcd_specs_single_po_without_conditions, a data frame with 5 variables and 4 rows; for abcd_specification_example_xtc and abcd_specs_dutch_xtc, a data frame with 7 variables and 5 rows' and for abcd_specification_empty, a data frame with 7 variables and 1 row.

Details

- Behavior Change Principles: The behavior change principles (BCPs), also known as methods for behavior change or 'behavior change techniques' (BCTs), that describe the psychological principles that are assumed to realise the change in the (sub-)determinants.
- Conditions for effectiveness\\n(e.g. parameters for use): The conditions for effectiveness that describe the constraints and considerations taken into account in the translation of the BCPs to practical applications for the relevant target population, context, culture, etc.

8 apply_graph_theme

• Applications: The applications of these BCPs. Where the BCPs describe theoretical principles, the applications are more or less tangible intervention elements.

- Sub-determinants\\n(e.g. beliefs; can be formulated as Change Objectives): The specific aspects of teh target population's psychology that are targeted by the BCPs (e.g. beliefs, or in Intervention Mapping vocabulary, Change Objectives).
- Determinants: The determinants, psychological constructs, that the targeted sub-determinants are a part of, and that together predict the Performance Objectives (sub-behaviors).
- Performance Objectives: Explicitly defined sub-behaviors at a level of specificity that distinguishes them from other sub-behaviors, and that together form the target behavior.
- Target Behavior: The ultimate target behavior, usually defined at a relatively general level.

In addition to these three datasets, a Dutch example specification is included named abcd_specs_dutch_xtc, and the same in English as abcd_specification_example_xtc.

Finally, abcd_specification_empty is an empty 'template' ABCD matrix.

apply_graph_theme

Apply multiple DiagrammeR global graph attributes

Description

Apply multiple DiagrammeR global graph attributes

Usage

```
apply_graph_theme(graph, ...)
```

Arguments

graph

The DiagrammeR::DiagrammeR graph to apply the attributes to.

. . .

One or more character vectors of length three, where the first element is the attribute, the second the value, and the third, the attribute type (graph, node, or

edge).

Value

The DiagrammeR::DiagrammeR graph.

cat0 9

cat0

Concatenate to screen without spaces

Description

The cat0 function is to cat what paste0 is to paste; it simply makes concatenating many strings without a separator easier.

Usage

```
cat0(..., sep = "")
```

Arguments

```
... The character vector(s) to print; passed to cat.
sep The separator to pass to cat, of course, "" by default.
```

Value

Nothing (invisible NULL, like cat).

Examples

```
cat0("The first variable is '", names(mtcars)[1], "'.");
```

CIBER

Confidence Interval-Based Estimation of Relevance (CIBER)

Description

This function generates a high-level plot consisting of several diamond plots. This function is useful for estimating the relative relevance of a set of determinants of, for example, behavior. The plot in the left hand panel shows each determinant's distribution with a diamond representing the confidence interval. The right hand plot shows the determinants' associations to one or more 'target' variables, such as behavior or determinants of behavior.

Usage

```
CIBER(
  data,
  determinants,
  targets,
  conf.level = list(means = 0.9999, associations = 0.95),
  subQuestions = NULL,
  leftAnchors = rep("Lo", length(determinants)),
  rightAnchors = rep("Hi", length(determinants)),
```

```
outputFile = NULL,
  outputWidth = NULL,
  outputHeight = NULL,
  outputUnits = "in",
  outputParams = list(),
  orderBy = NULL,
  decreasing = NULL,
  numberSubQuestions = FALSE,
 generateColors = list(means = c("red", "blue", "green"), associations = c("red",
    "grey", "green")),
  strokeColors = viridis::viridis(length(targets)),
  vLines = c(-0.5, 0, 0.5),
  vLineColors = "grey",

    "grey", "green")),
  strokeColors = viridis::viridis(length(targets)),
  vLines = c(-0.8, 0, 0.8),
  vLineColors = "grey",
  titlePrefix = "Means and associations (d) with",
  titleVarLabels = NULL,
  titleSuffix = "",
  fullColorRange = NULL,
  associationsAlpha = 0.5,
  returnPlotOnly = TRUE,
  drawPlot = TRUE,
  baseSize = 0.8,
  dotSize = 2.5 * baseSize,
  baseFontSize = 10 * baseSize,
  theme = ggplot2::theme_bw(base_size = baseFontSize),
 xbreaks = NULL,
)
detStructCIBER(
  determinantStructure,
  data,
  conf.level = list(means = 0.9999, associations = 0.95),
  subQuestions = NULL,
  leftAnchors = rep("Lo", length(determinants)),
  rightAnchors = rep("Hi", length(determinants)),
  orderBy = 1,
  decreasing = NULL,
 generateColors = list(means = c("red", "blue", "green"), associations = c("red",
    "grey", "green")),
  strokeColors = NULL,
  titlePrefix = "Means and associations with",
  titleVarLabels = NULL,
  titleSuffix = "",
  fullColorRange = NULL,
  associationsAlpha = 0.5,
 baseSize = 0.8,
  dotSize = 2.5 * baseSize,
 baseFontSize = 10 * baseSize,
  theme = ggplot2::theme_bw(base_size = baseFontSize),
)
```

Arguments

data The dataframe containing the variables.

determinants The 'determinants': the predictors (or 'covariates') of the target variables(s) (or

'criteria').

targets The 'targets' or 'criteria' variables: the variables predicted by the determinants.

conf.level The confidence levels for the confidence intervals: has to be a named list with

two elements: means and associations, specifying the desired confidence levels for the means and associations, respectively. The confidence level for the associations is also used for the intervals for the proportions of explained vari-

ance.

subQuestions The subquestions used to measure each determinants. This can also be used to

provide pretty names for the variables if the determinants were not measured by

one question each. Must have the same length as determinants.

leftAnchors The anchors to display on the left side of the left hand panel. If the deter-

minants were measured with one variable each, this can be used to show the anchors that were used for the respective scales. Must have the same length as

determinants.

rightAnchors The anchors to display on the left side of the left hand panel. If the deter-

minants were measured with one variable each, this can be used to show the anchors that were used for the respective scales. Must have the same length as

determinants.

outputFile The file to write the output to (the plot is not stored to disk if NULL). The exten-

sion can be specified to change the file type.

outputWidth, outputHeight, outputUnits

The width, height, and units for the output file.

outputParams More advanced parameters for the output file. This can be used to pass argu-

ments to ggplot2::ggsave(), such as passing outputParams=list(type="cairo-png")

to use anti-aliasing when saving a PNG file.

orderBy Whether to sort the determinants. Set to NULL to not sort at all; specify the name

or index of one of the targets to sort by the point estimates of the associations with that target variable. Use decreasing to determine whether to sort in ascending or descending order. For convenience, if orderBy is not NULL, but

decreasing is, the determinants are sorted in descending (decreasing) order.

decreasing Whether to sort the determinants. Specify NULL to not sort at all, TRUE to sort

in descending order, and FALSE to sort in ascending order. If decreasing is nor NULL, but orderBy is NULL, the determinants are sorted by their means. For convenience, if orderBy is not NULL, but decreasing is, the determinants are

sorted in descending (decreasing) order.

numberSubQuestions

Whether or not to number the subquestions. If they are numbered, they are

numbered from the top to the bottom.

generateColors The colors to use to generate the gradients for coloring the diamonds represent-

ing the confidence intervals. Has to be a named list with two elements: means and associations, specifying the desired colors for the means and associa-

tions, respectively.

strokeColors
The palette to use to color the stroke of the confidence intervals for the asso-

ciations between the determinants and the targets. Successive colors from this

palette are used for the targets.

vLines, vLineColors

In the association plot, vertical lines can be plotted to facilitate interpretation. Specify their locations and colors here, or set one or both to NULL to eliminate

them.

titlePrefix Text to add before the list of target names and the proportions of explained

variance for each target. This plot title also serves as legend to indicate which

target 'gets' which each color.

titleVarLabels Optionally, variable labels to use in the plot title. Has to be the exact same length

as targets.

titleSuffix Text to add after the list of target names and the proportions of explained vari-

ance for each target.

fullColorRange If colors are specified, this can be used to specify which values, for the de-

terminant confidence intervals in the left hand panel, are the minimum and maximum. This is useful if those scores are not actually in the data (e.g. for extremely skewed distributions). If NULL, the range of all individual scores on the determinants is used. For the associations, c(-1, 1) is always used as

fullColorRange.

associationsAlpha

The alpha level (transparency) of the confidence interval diamonds in the right hand plot. Value between 0 and 1, where 0 signifies complete transparency (i.e.

invisibility) and 1 signifies complete 'opaqueness'.

returnPlotOnly Whether to return the entire object that is generated (including all intermediate

objects) or only the plot.

drawPlot Whether the draw the plot, or only return it.

jitterWidth How much to jitter the data points in the left hand plot.

baseSize This can be used to efficiently change the size of most plot elements.

dotSize This is the size of the points used to show the individual data points in the left

hand plot.

baseFontSize This can be used to set the font size separately from the baseSize.

theme This is the theme that is used for the plots.

xbreaks Which breaks to use on the X axis (can be useful to override ggplot2's defaults).

rsq Whether to compute the R squared values.

... These arguments are passed on to biAxisDiamondPlot (for the left panel) and

diamondPlot (for the right panel). Note that all argument are passed to both

those functions.

comparisonColors

Colors to use for the two groups in a binary CIBER plot with one (dichotomous)

target.

categoryLabels Labels for the two values of the target.

determinantStructure

When using detStructCIBER, the determinant structure as generated by determinantStructure

is included here. determinants, targets, subQuestions, leftAnchors, and rightAnchors are then read from the determinantStructure object. In other

words: once a determinantStructure has been generated, only dat and determinantStructure

have to be provided as argument to generate a CIBER diamond plot.

Details

Details are explained in Crutzen & Peters (2017).

Value

Depending on the value of returnPlotOnly, either the plot only (a gtable object) or an object containing most objects created along the way (in which case the plot is stored in \$output\$plot).

The plot has width and height attributes which can be used when saving the plot.

CIBERlite 15

CIBERlite

CIBERlite

Description

CIBERlite plots can be used to quickly get an idea of means and correlations of a small number of determinants. They were developed to facilitate conducting and interpreting determinant studies by prevention professionals.

Usage

```
CIBERlite(
  data,
  determinants,
  targets,
  determinantOrder = NULL,
  determinantLabels = NULL,
  subDeterminantLabels = NULL,
  title = NULL,
  conf.level = 0.95,
  scaleRange = NULL,
  determinantAesthetics = list(fill = "black", color = NA, alpha = 0.5),
  subDeterminantAesthetics = list(fill = "black", color = NA, alpha = 0.5),
  rDiamondAesthetics = list(fill = "#c4c4c4", color = NA, alpha = 0.75)
)
```

Arguments

data The dataframe containing the variables.

determinants Either a character vector with the names of the determinants, or a list of named

character vectors, where each vector contains a number of subdeterminants, and each vector's name is the name of the more proximal determinant (i.e. that

'contains' those subdeterminants).

targets A character vector with the names of the targets (i.e. more proximal determi-

nants, behavior, etc).

determinantOrder

The order in which to display the determinants (if this needs to be different from the order as provided in determinants).

determinantLabels

The labels to use for the determinants.

subDeterminantLabels

The labels to use for the subdeterminants.

title The title of the plot.

conf.level The confidence levels: a list with two named values; the confidence level for

the means, named means, and the confidence level for the associations, named

associations.

16 complexs

scaleRange

The full range of the scale of the determinants/subdeterminants; the minimum and maximum values are used if this is not provided.

determinantAesthetics, subDeterminantAesthetics, rDiamondAesthetics

The aesthetics for the determinants, subdeterminants, and correlation diamonds, each a list containing three named values: fill, color, and alpha.

Details

More details will be provided in a forthcoming paper; until then, see https://CIBERlite.com

Value

A ggplot.

Examples

complecs

Create a COMPLECS graph

Description

COMPLECS was developed to help make sense of complex systems. It reads data from a number of worksheets in a spreadsheet and generates a diagram according to those specifications. Originally, COMPLECS was developed to visualise a problem during the needs assessment phase of intervention development.

Usage

```
complecs(
  input,
  title = "COMPLECS overview",
  layout = "fdp",
  graph_styling = list(c("outputorder", "edgesfirst", "graph"), c("overlap", "false",
        "graph"), c("fixedsize", "false", "node"), c("fontname", "Arial", "graph"),
  c("fontname", "Arial", "node"), c("fontname", "Arial", "edge"), c("headclip", "true",
        "edge"), c("tailclip", "false", "edge")),
  directed = TRUE,
  outputFile = NULL,
```

complecs 17

```
outputWidth = 1600,
  outputHeight = NULL,
  returnDotOnly = FALSE,
  returnSvgOnly = FALSE,
  returnGraphOnly = TRUE,
 maxLabelLength = 20,
  regExReplacements = opts$get("diagrammerSanitization"),
  silent = opts$get("silent")
)
## S3 method for class 'complecs'
print(
 Х,
 width = x$input$width,
 height = x$input$height,
  title = DiagrammeR::get_graph_name(x$output$graph),
)
## S3 method for class 'complecs'
print(
 width = x$input$width,
 height = x$input$height,
  title = DiagrammeR::get_graph_name(x$output$graph),
)
```

Arguments

input Either a link to a Google Sheet, or a path to an Excel file.

title The title of the COMPLECS graph.

1ayout The layout to use; has to be one of the DiagrammeR layout types (dot, neato,

circo and twopi).

graph_styling Additional styling to apply; a list with three-element vectors, where the three el-

ements correspond to, respectively, the attr, value, and attr_type arguments for $\mbox{DiagrammeR}$::add_global_graph_attrs(). Note that these attributes may

override attributes specified in the COMPLECS specification.

directed Whether to draw directed arrows or not.

outputFile A character vector where each element is one path (including filename) to write

the graph to.

outputWidth, outputHeight

If not NULL, a way to override the width and height when calling complecs to

generate a COMPLECS overview.

returnDotOnly Whether to only return the produced DOT code.

returnSvgOnly Whether to only return the SVG in a character vector.

18 complexs

whether to only return the produced graph.

maxLabelLength The number of characters where to wrap the labels.

regExReplacements

A list of pairs of regular expressions that will be applied to the specifications before generating the ABCD. This can be used to sanitize problematic characters (e.g. ', " and \).

silent

Whether to be chatty or silent.

X The object to print (i.e. a result of a call to complecs).

width, height

If not NULL, a way to override the width and height when calling print to print a COMPLECS overview.

Any additional arguments for the print() method are passed to DiagrammeR::render_graph().

Details

COMPLECS is a recursive acronym for COMPLECS Organises Multiple Players & Linked Environments using Connected Specifications.

Value

A complecs object that includes the graph and the graph in SVG in output\$graph and output\$graphSvg.

```
## Not run:
### Path in the package with example COMPLECS
exampleCOMPLECS <-
 system.file(
    "extdata",

 )
);
## End(Not run)
```

complecs_to_precede 19

complecs_to_precede Represent a COMPLECS specification as a PRECEDE model

Description

This function reads in a complex specification and draw a PRECEDE model, with a number of assumptions (see Details section).

Usage

```
complecs_to_precede(
  input,
  title = "PRECEDE diagram",
  layout = "fdp",
 graph_styling = list(c("outputorder", "edgesfirst", "graph"), c("rankdir", "LR",
    "graph"), c("overlap", "false", "graph"), c("fixedsize", "false", "node"),
  c("fontname", "Arial", "graph"), c("fontname", "Arial", "node"), c("fillcolor",
    "White", "node"), c("shape", "box", "node"), c("style", "filled", "node"),
  c("fontname", "Arial", "edge"), c("headclip", "true", "edge"), c("tailclip", "false",
    "edge")),
  directed = TRUE,
  outputFile = NULL,
  outputWidth = 1600,
  outputHeight = NULL,
  returnDotOnly = FALSE,
  returnSvgOnly = FALSE,
  returnGraphOnly = TRUE,
 maxLabelLength = 60,
  regExReplacements = opts$get("diagrammerSanitization"),
  silent = opts$get("silent")
)
```

Arguments

input

title	The title of the COMPLECS graph.
layout	The layout to use; has to be one of the DiagrammeR layout types (dot, circo and twopi).
graph styling	Additional styling to apply: a list with three-element vectors, where the tl

Either a link to a Google Sheet, or a path to an Excel file.

Additional styling to apply; a list with three-element vectors, where the three elements correspond to, respectively, the attr, value, and attr_type arguments for DiagrammeR::add_global_graph_attrs(). Note that these attributes may override attributes specified in the COMPLECS specification.

neato,

directed Whether to draw directed arrows or not.

outputFile A character vector where each element is one path (including filename) to write

the graph to.

```
outputWidth, outputHeight
```

If not NULL, a way to override the width and height when calling complecs to generate a COMPLECS overview.

returnDotOnly Whether to only return the produced DOT code.

returnSvgOnly Whether to only return the SVG in a character vector.

returnGraphOnly

Whether to only return the produced graph.

maxLabelLength The number of characters where to wrap the labels.

regExReplacements

A list of pairs of regular expressions that will be applied to the specifications before generating the ABCD. This can be used to sanitize problematic characters (e.g. ', " and \).

silent

Whether to be chatty or silent.

Details

Only entities with the following entity types are used from the COMPLECS specification:

- person
- organization
- environmental_condition
- behavior
- determinant
- outcome

Furthermore, it will be assumed that the only direct connections from behavior entities to outcome entities belong to the focal population; therefore, if behaviors of environmental actors are important for an outcome, those behaviors' effects must be represented as environmental_condition entities - otherwise the relevant persons or organizationss will be erroneously considered as focal population members.

Value

A complex object that includes the graph and the graph in SVG in output\$graph and output\$graphSvg.

```
## Not run:
### Path in the package with example COMPLECS
exampleCOMPLECS <-
    system.file(
        "extdata",
        "COMPLECS-spec-example.xlsx",
        package = "behaviorchange"
    );
behaviorchange::complecs_to_precede(
    exampleCOMPLECS</pre>
```

```
### Loading that COMPLECS from a google sheet - but note that
### this requires an internet connection!
behaviorchange::complecs_to_precede(

   )
);
## End(Not run)
```

convert.threshold.to.er

Visualising Numbers Needed for Change

Description

These functions can be used to visualise Numbers Needed for Change (or Numbers Needed to Treat). erDataSeq is a helper function to generate an Event Rate Data Sequence, and it uses convert.threshold.to.er and convert.er.to.threshold to convert thresholds to event rates and vice versa.

Usage

```
convert.threshold.to.er(
  threshold,
 mean,
  eventIfHigher = TRUE,
  pdist = stats::pnorm
)
convert.er.to.threshold(
  er,
 mean,
  sd,
  eventIfHigher = TRUE,
  qdist = stats::qnorm
)
erDataSeq(
  er = NULL,
  threshold = NULL,
 mean = NULL,
  sd = NULL,
  eventIfHigher = TRUE,
```

```
pRange = c(1e-06, 0.99999),
 xStep = 0.01
)
ggNNC(
  cerDataSeq,
 d = NULL,
  eventDesirable = TRUE,
  r = 1.
  xlab = "Continuous outcome",
  plotTitle = c("Numbers Needed for Change = ", ""),
  theme = ggplot2::theme_bw(),
  lineSize = 1,
  cerColor = "#EBF2F8",
  eerColor = "#172F47",
  cerLineColor = "#888888",
  eerLineColor = "#000000",
  dArrowColor = "#000000",
  cerAlpha = 0.66,
  eerAlpha = 0.66,
  xLim = NULL,
  xLimAutoDensityTolerance = 0.001,
  showLegend = TRUE,
  verticalLineColor = "#172F47",
  desirableColor = "#00FF00",
  desirableAlpha = 0.2,
  undesirableColor = "#FF0000",
  undesirableAlpha = 0.2,
  desirableTextColor = "#009900",
  undesirableTextColor = "#990000",
  dArrowDistance = 0.04 * max(cerDataSeq$density),
  dLabelDistance = 0.08 * max(cerDataSeq$density)
)
```

Arguments

threshold If the event rate is not available, a threshold value can be specified instead, which

is then used in conjunction with the mean (mean) and standard deviation (sd) and

assuming a normal distribution to compute the event rate.

mean The mean of the control group distribution.

sd The standard deviation (of the control distribution, but assumed to be the same

for both distributions).

eventIfHigher Whether scores above or below the threshold are considered 'an event'.

pdist, qdist Distributions to use when converting thresholds to event rates and vice versa;

defaults to the normal distribution.

er Event rate to visualise (or convert).

pRange The range of probabilities for which to so the distribution.

xStep Precision of the drawn distribution; higher values mean lower precision/granularity/resolution.

cerDataSeq The cerDataSeq object. d The value of Cohen's d.

eventDesirable Whether an event is desirable or undesirable.

The correlation between the determinant and behavior (for mediated NNC's).

xlab The label to display for the X axis.

plotTitle The title of the plot; either one character value, this value if used; if two, they

are considered a prefix and suffix to be pre/appended to the NNC value.

theme The theme to use for the plot.

lineSize The thickness of the lines in the plot.

cerColor The color to use for the event rate portion of the control group distribution.

eerColor The color to use for the event rate portion of the experimental group distribution.

cerLineColor The line color to use for the control group distribution.

eerLineColor The line color to use for the experimental group distribution.

dArrowColor The color of the arrow to show the effect size.

cerAlpha The alpha value (transparency) to use for the control group distribution.

eerAlpha The alpha value (transparency) to use for the control group distribution.

xLim This can be used to manually specify the limits for the X axis; if NULL, sensible

limits will be derived using xLimAutoDensityTolerance.

xLimAutoDensityTolerance

If xLim is NULL, the limits will be set where the density falls below this propor-

tion of its maximum value.

showLegend Whether to show the legend (only if showing two distributions).

verticalLineColor

The color of the vertical line used to indicate the threshold.

desirableColor The color for the desirable portion of the X axis.

desirableAlpha The alpha for the desirable portion of the X axis.

undesirableColor

The color for the undesirable portion of the X axis.

undesirableAlpha

The color for the undesirable portion of the X axis.

desirableTextColor

The color for the text to indicate the desirable portion of the X axis.

undesirableTextColor

The color for the text to indicate the undesirable portion of the X axis.

dArrowDistance The distance of the effect size arrow from the top of the distributions.

dLabelDistance The distance of the effect size label from the top of the distributions.

Details

These functions are used by nnc() to show the distributions, and event rates. They probably won't be used much on their own.

Value

```
erDataSeq returns a data sequence; ggNNC a ggplot2::ggplot().
```

```

determinantStructure 25

determinantStructure Determinant Structure specification

Description

These functions can be used to specify a determinant structure: a hierarchical structure of determinants that can then be conveniently plotted and analysed, for example using detStructCIBER. These functions are made to be used together; see the example and the forthcoming article for more information.

Usage

```
determinantStructure(name, selection = NULL, ...)

determinantVar(name, selection = NULL, ...)

subdeterminants(name, selection = NULL, ...)

subdeterminantProducts(name, selection = NULL, ...)

## S3 method for class 'determinantStructure'
plot(x, useDiagrammeR = FALSE, ...)

## S3 method for class 'determinantStructure'
print(x, ...)
```

Arguments

name	The name of the variable that is specified.
selection	A regular expression to use to select the variables in a dataframe that are considered items that together form this variable. For determinantStructure, a list can be provided that also contains a named regular expression with the name 'behaviorRegEx', which specifies the name of the behavior to which this determinant structure pertains.
• • •	Any additional arguments are other determinant structure building functions. These are used to construct the determinant structure 'tree'.
x	The determinantStructure object to print or plot.
useDiagrammeR	Whether to simply use $print(plot(x))$ (if FALSE) or whether to use data.tree::ToDiagrammeRGraph, tweak it a bit, by setting global graph attributes, and then using DiagrammeR::render_graph (if TRUE).

Details

This family of functions will be explained more in detail in a forthcoming paper. plot and print methods plot and print a determinantStructure object.

Value

A determinantStructure object, which is a data.tree object.

Examples

```
determinantStructure('using R',
                     list('using R',
                          behaviorRegEx = 'some RegEx'),
                     determinantVar("Intention",
                                     "another RegEx",
                                     determinantVar("Attitude",
                                                    "third RegEX",
                                                    subdeterminants("Likelihood",
                                                                     "4th RegEx"),
                                                   subdeterminants("Evaluation",
                                                                    "5th RegEx"),
                                                   subdeterminantProducts("attProduct",
                                                                           c("4th RegEx",
                                                                           "5th RegEx"))),
                                     determinantVar("perceivedNorm",
                                                    "6th RegEx",
                                                    subdeterminants("Approval",
                                                                     "7th RegEx"),
                                                  subdeterminants("Motivation to comply",
                                                                     "8th RegEx"),
                                                    subdeterminantProducts("normProduct",
                                                                           c("7th RegEx",
                                                                           "8th RegEx"))),
                                               determinantVar("pbc",
                                                               "9th RegEx",
                                                       subdeterminants("Control beliefs",
                                                                         "10th RegEx"))));
```

determinant_selection_table

Potential for Change Index and the Determinant Selection Table

Description

These functions compute the Potential for Change Index for one or multiple (sub-)determinants, the room for improvement (an intermediate estimate), and produce a convenient table with an overview of all (sub-)determinants. Note that for determinant selection purposes, quantitative estimates such as the Potential for Change Index should never be used without also thoroughly inspecting the visualisations of the univariate distributions and the confidence intervals for the associations to the ultimate intervention targets (usually the target behavior or a proxy measure). For this purpose, the Confidence Interval-Based Estimation of Relevance plots can be used (see CIBER()).

Usage

```
determinant_selection_table(
  data,
  determinants,
  target,
  determinantLabels = NULL,
  targetLabel = NULL,
  sortBy = NULL,
  sortByAbs = TRUE,
  decreasing = TRUE,
  digits = 3,
  increasesAreImprovements = TRUE,
 minimum = base::min,
 maximum = base::max,
  center = base::mean,
 weight = stats::cor,
  type = NULL,
 minimumArgs = list(na.rm = TRUE),
 maximumArgs = list(na.rm = TRUE),
  centerArgs = list(na.rm = TRUE),
 weightArgs = list(use = "complete.obs"),
  potentialScale = NULL,
  headingLevel = 3,
  output = behaviorchange::opts$get("tableOutput")
)
determinantSelectionTable_partial(
  digits = attr(x, "digits"),
  headingLevel = attr(x, "headingLevel"),
  echoPartial = FALSE,
  partialFile = NULL,
  quiet = TRUE,
)
## S3 method for class 'determinantSelectionTable'
knit_print(
```

```
Χ,
  digits = attr(x, "digits"),
  headingLevel = attr(x, "headingLevel"),
  echoPartial = FALSE,
  partialFile = NULL,
 quiet = TRUE,
)
## S3 method for class 'determinantSelectionTable'
print(
 х,
 digits = attr(x, "digits"),
 headingLevel = attr(x, "headingLevel"),
 output = attr(x, "output"),
  forceKnitrOutput = FALSE,
)
potential_for_change_index(
  data,
  determinants,
  target,
  increasesAreImprovements = TRUE,
  sampleLevel = FALSE,
 minimum = base::min,
 maximum = base::max,
  center = base::mean,
 weight = stats::cor,
  type = NULL,
 minimumArgs = list(na.rm = TRUE),
 maximumArgs = list(na.rm = TRUE),
 centerArgs = list(na.rm = TRUE),
 weightArgs = list(use = "complete.obs")
)
room_for_improvement(
  increasesAreImprovements = TRUE,
  sampleLevel = FALSE,
 minimum = base::min,
 maximum = base::max,
  center = base::mean,
 minimumArgs = list(na.rm = TRUE),
 maximumArgs = list(na.rm = TRUE),
  centerArgs = list(na.rm = TRUE),
  varName = NULL
)
```

Arguments

data The dataframe containing the variables.

determinants The name(s) of the determinant(s).

target The target (e.g. behavior or intention).

determinantLabels, targetLabel

Optionally, labels to use for the (sub-)determinants and the target. The determinantLabels

must have the same order as the determinants vector.

sortBy The column to sort the results by; if not NULL, a number from 1-6 that corre-

sponds to the six columns of the Determinant Selection Table.

sortByAbs Whether to sort by raw values (FALSE) or their absolute value (TRUE).

decreasing Whether to sort in decreasing (TRUE) or increasing (FALSE) order.

digits The number of digits to round to.

increasesAreImprovements

Whether increases are improvements (TRUE) or decreases are improvements (FALSE).

minimum, maximum

The minimum and maximum, as functions that take a vector and return the minimum and maximum scores, as numbers, or as vectors of numbers specifying the minimum and maximum to use for each column in x or determinants, or a lists of functions specifying the functions to use for each column in x or

determinants.

center For the sample-level version, a function that takes a vector and returns the center

(e.g. mean, median, etc), or a list of functions specifying the function to use for

each column in x or determinants.

weight The function to return the weight/multiplier to use in the computation.

type The type of potential for change index. Currently implemented are type '1' and

type '2' - see details for more information.

minimumArgs, maximumArgs, centerArgs, weightArgs

lists with arguments to pass to the corresponding functions. Note that these are

not vectorized.

potentialScale The scale with minimum and maximum possible values for the Potential for

Change index. If NULL, the minimum is set to \emptyset and the maximum is set to the

highest observed value.

headingLevel The number of hashes to print in front of the headings when printing while

knitting

output Whether to only output to the viewer (if possible; output='viewer'), or only to

the console (output='console'), or to both (output=c('viewer', 'console')).

Note that displaying in the viewer requires the htmltools package.

For room for improvement, either a numeric vector with scores on a (sub-)determinant,

or a data frame with multiple such vectors. For the Determinant Selection Table

functions, the object to print/knit.

echoPartial Whether to show the executed code in the R Markdown partial (TRUE) or not

(FALSE).

partialFile This can be used to specify a custom partial file. The file will have object x

available.

quiet Passed on to knitr::knit() whether it should e chatty (FALSE) or quiet (TRUE).

... Any additional arguments are passed to the default print method by the print

method, and to rmdpartials::partial() when knitting a RMarkdown partial.

forceKnitrOutput

Force knitr output.

sampleLevel Whether to return sample-level estimates (TRUE) or individual-level estimates

(FALSE).

varName For internal use.

Details

The Potential for Change index was developed by Keegan et al. and is a numerical representation of a number of important features in CIBER() plots (for more details, please see the references below). It turned out a similar measure, the Intervention Potential, was developed by Huber & Mosler (2013). The latter uses regression coefficients as weights, which is problematic for a number of reasons (see Crutzen, Peters & Noijen, 2017), and has therefore not been implemented as a default, but it is possible to use regression coefficients by specifying a custom weight function.

The original Potential for Change Index was conceptualized to optimize intervention tailoring and improve the prediction of individual-level intervention effectiveness. A second conceptualization of the Potential for Change Index can facilitate sub-determinant selection.

In addition to using the minimum, maximum, center, and weight functions to specify custom functions, specific types have also been implemented to quickly use a prespecified combination of functions.

The first (type = '1') is computed as follows:

- For sub-determinants with a positive zero-order correlation with behavior, the sample mean is subtracted from the observed maximum score, and the result is multiplied by the zero-order correlation;
- For sub-determinants with a negative zero-order correlation with behavior, the sample mean
 is subtracted from the observed minimum score, and the result is multiplied by the zero-order
 correlation.

The second (type = '2') is computed as follows:

- For sub-determinants with a positive zero-order correlation with behavior, the sample mean is subtracted from the .95 quantile of the scores, and the result is multiplied by the squared zero-order correlation (i.e. the proportion of explained variance);
- For sub-determinants with a negative zero-order correlation with behavior, the sample mean is subtracted from the .05 quantile of the scores, and the result is multiplied by the squared zero-order correlation (i.e. the proportion of explained variance);

The second variant effectively takes the 5% trimmed maximum and minimum, rendering it less sensitive to outliers, penalizes weak associations with behavior more severely, and decreases sensitivity to differences between correlations. These differences should render the second variant a bit more robust over different samples.

The room for improvement is one of the ingredients of the Potential for Change Index or P_delta, a generalized version of the Intervention Potential. The Determinant Selection Table efficiently presents the Potential for Change Indices for a set of (sub-)determinants.

Value

For the individual-level version, a vector or data frame with the same dimensions as provided; for the sample-level version, if a vector is provided, a single number, and if a data frame is provided, a vector with as many values as the data frame has columns. For Determinant Selection Table, a data frame.

detStructAddVarLabels 33

detStructAddVarLabels Functions to preprocess determinant structures

Description

These functions are used in conjunction with the determinantStructure family of funtions to conveniently work with determinant structures.

Usage

```
detStructAddVarLabels(
  determinantStructure,
  varLabelDf,
  varNameCol = "varNames.cln",
  leftAnchorCol = "leftAnchors",
  rightAnchorCol = "rightAnchors",
  subQuestionCol = "subQuestions";
  questionTextCol = "questionText"
)
detStructAddVarNames(determinantStructure, names)
detStructComputeProducts(determinantStructure, data, append = TRUE)
detStructComputeScales(
  determinantStructure,
  data,
  append = TRUE,
  separator = "_"
)
```

34 detStructAddVarLabels

Arguments

determinantStructure

The determinantStructure object.

varLabelDf The variable label dataframe as generated by the processLSvarLabels in the

userfriendlyscience package. It is also possible to specify a 'homemade' dataframe, in which case the column names have to specified (see the next argu-

ments).

varNameCol The name of the column of the varLabelDf that contains the variable name.

Only needs to be changed from the default value if varLabelDf is not a dataframe

as produced by processLSvarLabels.

leftAnchorCol The name of the column of the varLabelDf that contains the left anchor. Only

needs to be changed from the default value if varLabelDf is not a dataframe as

produced by processLSvarLabels.

rightAnchorCol The name of the column of the varLabelDf that contains the right anchor. Only

needs to be changed from the default value if varLabelDf is not a dataframe as

produced by processLSvarLabels.

subQuestionCol The name of the column of the varLabelDf that contains the subquestion. Only

needs to be changed from the default value if varLabelDf is not a dataframe as

produced by processLSvarLabels.

questionTextCol

The name of the column of the varLabelDf that contains the question text. Only

needs to be changed from the default value if varLabelDf is not a dataframe as

produced by processLSvarLabels.

names A character vector with the variable names. These are matched against the reg-

ular expressions as specified in the determinantStructure object, and any

matches will be stored in the determinantStructure object.

data The dataframe containing the data; the variables names specified in names (when

calling detStructAddVarNames) must be present in this dataframe.

append Whether to only return the products or scales, or whether to append these to the

dataframe and return the entire dataframe.

separator The separator to use when constructing the scale variables names.

Details

This family of functions will be explained more in detail in a forthcoming paper.

Value

detStructAddVarLabels and detStructAddVarNames just change the determinantStructure object; detStructComputeProducts and detStructComputeScales return either the dataframe with the new variables appended (if append = TRUE) or just a dataframe with the new variables (if append = FALSE).

dMCD

dMCD

Estimate Cohen's d corresponding to a Meaningful Change Definition

Description

This function uses a base rate (Control Event Rate, argument cer) and a Meaningful Change Definitions (MCD, argument mcd) to compute the corresponding Cohen's d. See Gruijters & Peters (2019) for details.

Usage

```
dMCD(
  cer,
 mcd = NULL,
  eer = NULL,
  plot = TRUE,
  mcdOnX = FALSE,
  plotResultValues = TRUE,
  resultValueLineColor = "blue",
  resultValueLineSize = 1,
  returnLineLayerOnly = FALSE,
  theme = ggplot2::theme_bw(),
  highestPossibleEER = 0.999999999,
  xLab = ifelse(mcdOnX, "Meaningful Change Definition", "Control Event Rate"),
  yLab = "Cohen's d",
  dist = "norm",
  distArgs = list(),
  distNS = "stats",
)
## S3 method for class 'dMCD'
print(x, ...)
```

Arguments

cer	The Control Event Rate (or base rate): how many people already perform the target behavior in the population (as a proportion)?
mcd	The Meaningful Change Definitions: by which percentage (as a proportion) should the event rate increase to render an effect meaningful?
eer	Instead of the MCD, it is also possible to specify the Experimental Event Rate (EER), in which case the MCD is computed by taking the difference with the CER.
plot	Whether to show a plot.
mcd0nX	Whether to plot the Meaningful Change Definition on the X axis (by default, the CER is plotted on the X axis).

lm_rSq_ci 37

plotResultValues

Whether to plot the result values.

resultValueLineColor, resultValueLineSize

If plotting the result values, lines of this color and size are used.

returnLineLayerOnly

Whether to only return a layer with the plotted line (which can be used to quickly stack lines for different MCDs).

theme

The ggplot2 theme to use.

highestPossibleEER

The highest possible EER to include in the plot.

xLab, yLab

The labels for the X and Y axes.

dist, distArgs, distNS

Used to specify the distribution to use to convert between Cohen's d and the CER and EER. distArgs can be used to specify additional arguments to the corresponding q and p functions, and distNS to specify the namespace (i.e. package) from where to get the distribution functions.

. . .

Any additional arguments to dMCD are passed on to the ggplot2::geom_line used to draw the line showing the different Cohen's d values as a function of the base rate (or MCD) on the X axis. Additional arguments for the print method are passed on to the default print method.

Χ

The object to print (i.e. a result from a call to dMCD).

Value

The Cohen's d value, optionally with a ggplot2 plot stored in an attribute (which is only a ggplot2 layer if returnLineLayerOnly=TRUE).

References

Gruijters, S. L. K., & Peters, G.-J. Y. (2020). Meaningful change definitions: Sample size planning for experimental intervention research. *PsyArXiv*. doi: 10.31234/osf.io/jc295

Examples

```
dMCD(.2, .05);
```

lm_rSq_ci

Obtaining an R squared confidence interval estimate for an lm regression

Description

The lm_rSq_ci function uses the base R lm function to conduct a regression analysis and then computes the confidence interval for R squared.

38 nnc

Usage

```
lm_rSq_ci(
  formula,
  data = NULL,
  conf.level = 0.95,
  ci.method = c("widest", "r.con", "olkinfinn"),
  env = parent.frame()
)
```

Arguments

The formula of the regression analysis, of the form y ~ x1 + x2, where y is the dependent variable and x1 and x2 are the predictors.

If the terms in the formula aren't vectors but variable names, this should be the dataframe where those variables are stored.

Conf.level The confidence of the confidence interval around the regression coefficients.

Which method to use for the confidence interval around R squared.

The environment where to evaluate the formula.

Value

The confidence interval

Author(s)

Gjalt-Jorn Peters

Maintainer: Gjalt-Jorn Peters gjalt-jorn@a-bc.eu

Examples

```
### Do a simple regression analysis
lm_rSq_ci(age ~ circumference, dat=Orange);
```

nnc

Numbers Needed for Change

Description

This function computes the Numbers Needed for Change, and shows a visualisation to illustrate them. Numbers Needed for Change is the name for a Numbers Needed to Treat estimate that was computed for a continuous outcome as is common in behavior change research.

nnc 39

Usage

```
nnc(
  d = NULL,
  cer = NULL,
  r = 1,
  n = NULL,
  threshold = NULL,
 mean = 0,
  sd = 1,
  poweredFor = NULL,
  thresholdSensitivity = NULL,
  eventDesirable = TRUE,
  eventIfHigher = TRUE,
  conf.level = 0.95,
  dReliability = 1,
  d.ci = NULL,
  cer.ci = NULL,
  r.ci = NULL,
  d.n = NULL
  cer.n = NULL,
  r.n = NULL,
  plot = TRUE,
  returnPlot = TRUE,
  silent = FALSE
)
## S3 method for class 'nnc'
print(x, digits = 2, ...)
```

Arguments

d The value of Cohen's d. cer The Control Event Rate.

r The correlation between the determinant and behavior (for mediated Numbers

Needed for Change).

The sample size.

threshold If the event rate is not available, a threshold value can be specified instead, which

is then used in conjunction with the mean (mean) and standard deviation (sd) and

assuming a normal distribution to compute the event rate.

mean The mean value, used to draw the plot, or, if no CER is provided but instead the

threshold value, to compute the CER.

sd The standard deviation, used to draw the plot (and to compute the CER if a

threshold value is supplied instead of the CER).

poweredFor The Cohen's d value for which the study was powered. This expected Cohen's

d value can be used to compute the threshold, which then in turn is used to compute the CER. To use this approach, also specify the mean and the standard

deviation.

40 nnc

thresholdSensitivity

This argument can be used to provide a vector of potential threshold values, each of which is used to compute an NNC. This enables easy inspection of whether the value chosen as threshold matters much for the NNC.

eventDesirable Whether an event is desirable or undesirable.

eventIfHigher Whether scores above or below the threshold are considered 'an event'.

conf.level The confidence level of the confidence interval.

to correct for the resulting attenuation using ufs::disattenuate.d() before computating the Experimental Event Rate. Use this argument to specify the reliability of the outcome measure. By default, the setting of 1 means that no

disattenuation is applied.

d.ci Instead of providing a point estimate for Cohen's d, a confidence interval can be

provided.

cer.ci Instead of providing a point estimate for the Control Event Rate, a confidence

interval can be provided.

r.ci Instead of providing a point estimate for the correlation, a confidence interval

can be provided.

d.n In addition to providing a point estimate for Cohen's d, a sample size can be

provided; if it is, the confidence interval is computed.

cer.n In addition to providing a point estimate for the Control Event Rate, a sample

size can be provided; if it is, the confidence interval is computed.

r.n In addition to providing a point estimate for the correlation, a sample size can

be provided; if it is, the confidence interval is computed.

plot Whether to generate and show the plot.

returnPlot Whether to return the plot (as an attribute), or to only display it.

silent Whether to suppress notifications.

x The nnc object to print.

digits The number of digits to round to.

... Any additional arguments are passed to the print function.

Details

Numbers Needed to Treat is a common and very useful effect size measure in use in the medical sciences. It is computed based on the Control Event Rate (CER) and the Experimental Event Rate (EER), and expresses how many people would need to received a treatment to yield a beneficial result for one person. In behavior change research, a similar measure would be useful, but the outcome is normally not dichotomous as is common in the medical literature (i.e. whether a participants survives or is cured), but continuous. Numbers Needed for Change fills this lacuna: it is simply the Numbers Needed to Treat, but converted from a Cohen's d value. nnt is an alias for nnc.

For more details, see Gruijters & Peters (2019) for details.

Value

The Numbers Needed for Change (NNC), potentially with a plot visualising the NNC in an attribute.

opts 41

Author(s)

Gjalt-Jorn Peters & Stefan Gruijters

Maintainer: Gjalt-Jorn Peters gjalt-jorn@userfriendlyscience.com

References

Gruijters, S. L., & Peters, G. Y. (2019). Gauging the impact of behavior change interventions: A tutorial on the Numbers Needed to Treat. *PsyArXiv.* doi: 10.31234/osf.io/2bau7

Examples

```
### Simple example
behaviorchange::nnc(d=.4, cer=.3);

### Or for a scenario where events are undesirable, and the
### intervention effective (therefore having a negative value for d):
behaviorchange::nnc(d=-.4, cer=.3, eventDesirable=FALSE);
```

opts

Options for the behaviorchange package

Description

The behaviorchange::opts object contains three functions to set, get, and reset options used by the escalc package. Use behaviorchange::opts\$set to set options, behaviorchange::opts\$get to get options, or behaviorchange::opts\$reset to reset specific or all options to their default values.

Usage

opts

Format

An object of class list of length 4.

Details

It is normally not necessary to get or set behaviorchange options.

The following arguments can be passed:

... For behaviorchange::opts\$set, the dots can be used to specify the options to set, in the format option = value, for example, EFFECTSIZE_POINTESTIMATE_NAME_IN_DF = "\n". For behaviorchange::opts\$reset, a list of options to be reset can be passed.

option For behaviorchange::opts\$set, the name of the option to set.

42 partypanelData

default For behaviorchange::opts\$get, the default value to return if the option has not been manually specified.

To see the full list of options and their default values, use behaviorchange::opts\$default(). Some examples are:

```
aabbcc A color theme for abcd().
complecs_* The worksheet and columns names for complecs().
silent Whether to be chatty or silent.
```

Examples

```
### Get the default utteranceMarker
behaviorchange::opts$get(complecs_entitySheet);

### Set it to a custom version, so that every line starts with a pipe
behaviorchange::opts$set(complecs_entitySheet = "sheet_with_entities");

### Check that it worked
behaviorchange::opts$get(complecs_entitySheet);

### Reset this option to its default value
behaviorchange::opts$reset(complecs_entitySheet);

### Check that the reset worked, too
behaviorchange::opts$get(complecs_entitySheet);
```

partypanelData

Subsets of Party Panel datasets

Description

These are subsets of Party Panel datasets. Party Panel is an annual semi-panel determinant study among Dutch nightlife patrons, where every year, the determinants of another nightlife-related risk behavior are mapped.

Usage

```
data(BBC_pp15.1)
data(BBC_pp16.1)
data(BBC_pp17.1)
data(BBC_pp18.1)
```

pies 43

Format

For BBC_pp15.1, a data.frame with 123 columns and 829 rows. For BBC_pp16.1, a data.frame with 63 columns and 1077 rows. For BBC_pp17.1, a data.frame with 94 columns and 943 rows. For BBC_pp18.1, a data.frame with 84 columns and 880 rows. Note that many rows contain missing values; the columns and rows were taken directly from the original Party Panel datasets, and represent all participants that made it past a given behavior.

Details

The behaviors of the Party Panel waves were:

- 2015: Behaviors related to using highly dosed ecstasy pills
- 2016: Behaviors related to visiting nightlife first-aid facilities
- 2017: Behaviors related to hearing protection
- 2018: Behaviors related to flirting and boundary crossing
- 2019: Behaviors related to sleeping hygiene surrounding nightlife participation

The full datasets are publicly available through the Open Science Framework (https://osf.io/s4fmu/). Also see the GitLab repositories (https://gitlab.com/partypanel) and the website at https://partypanel.eu.

Examples

pies

Practically Important Effect Sizes

Description

Practically Important Effect Sizes

Usage

```
pies(
  data = NULL,
  controlCol = NULL,
  expCol = NULL,
  d = NULL,
  cer = NULL,
  r = 1,
  n = NULL,
```

repeatStr

```
threshold = NULL,
mean = 0,
sd = 1,
bootstrapA = FALSE,
conf.level = 0.95
)
```

Arguments

data Optionally, if you want to get A, a data frame.

controlCol, expCol

Optionally, if you want to get A, the names of the columns with control and

experimental data.

d Cohen's d.

cer The control even rate (see nnt()).

r, threshold, mean, sd

Arguments for the nnt() function.

n The sample size.

bootstrapA Whether to use bootstrapping to compute A. conf.level The confidence level of confidence intervals.

Value

A dataframe with all values.

Examples

```
pies(d = .5, n = 100, cer = .2, threshold = 2);
```

repeatStr

Repeat a string a number of times

Description

Repeat a string a number of times

Usage

```
repeatStr(n = 1, str = " ")
```

Arguments

n, str

Normally, respectively the frequency with which to repeat the string and the string to repeat; but the order of the inputs can be switched as well.

vecTxt 45

Value

A character vector of length 1.

Examples

```
### 10 spaces:
repStr(10);
### Three euro symbols:
repStr("\u20ac", 3);
```

vecTxt

Easily parse a vector into a character value

Description

Easily parse a vector into a character value

Usage

```
vecTxt(
  vector,
  delimiter = ", ",
  useQuote = "",
  firstDelimiter = NULL,
  lastDelimiter = " & ",
  firstElements = 0,
  lastElements = 1,
  lastHasPrecedence = TRUE
)

vecTxtQ(vector, useQuote = "'", ...)
```

Arguments

vector The vector to process.
delimiter, firstDelimiter, lastDelimiter

The delimiters to use for respectively the middle, first firstElements, and last lastElements elements.

useQuote

This character string is pre- and appended to all elements; so use this to quote all elements (useQuote="'"), doublequote all elements (useQuote='"'), or anything else (e.g. useQuote='|'). The only difference between vecTxt and vecTxtQ is that the latter by default quotes the elements.

firstElements, lastElements

The number of elements for which to use the first respective last delimiters

46 wrap Vector

lastHasPrecedence

If the vector is very short, it's possible that the sum of firstElements and lastElements is larger than the vector length. In that case, downwardly adjust the number of elements to separate with the first delimiter (TRUE) or the number of elements to separate with the last delimiter (FALSE)?

... Any addition arguments to vecTxtQ are passed on to vecTxt.

Value

A character vector of length 1.

Examples

```
vecTxtQ(names(mtcars));
```

wrapVector

Wrap all elements in a vector

Description

Wrap all elements in a vector

Usage

```
wrapVector(x, width = 0.9 * getOption("width"), sep = "\n", ...)
```

Arguments

```
    x The character vector
    width The number of
    sep The glue with which to combine the new lines
    ... Other arguments are passed to strwrap().
```

Value

A character vector

Examples

```
res <- wrapVector(
   c(
     "This is a sentence ready for wrapping",
     "So is this one, although it's a bit longer"
   ),
   width = 10
);
print(res);
cat(res, sep="\n");</pre>
```
