

Package ‘dataquieR’

November 16, 2022

Title Data Quality in Epidemiological Research

Version 1.0.13

Description Data quality assessments guided by a 'data quality framework introduced by Schmidt and colleagues, 2021' <[doi:10.1186/s12874-021-01252-7](https://doi.org/10.1186/s12874-021-01252-7)> target the data quality dimensions integrity, completeness, consistency, and accuracy. The scope of applicable functions rests on the availability of extensive metadata which can be provided in spreadsheet tables. Either standardized (e.g. as 'html5' reports) or individually tailored reports can be generated. For an introduction into the specification of corresponding metadata, please refer to the 'package website' <https://dataquality.ship-med.uni-greifswald.de/Annotation_of_Metadata.html>.

.variable_arg_roles *Variable-argument roles*

Description

A Variable-argument role is the intended use of an argument of a indicator function – an argument that refers variables. In general for the table .variable_arg_roles, the suffix `_var` means one variable allowed, while `_vars` means more than one. The default sets of arguments for [util_correct_variable_use/util_correct_variable_](#) are defined from the point of usage, e.g. if it could be, that NAs are in the list of variable names, the

function should be able to remove certain response variables from the output and not disallow them by setting `allow_na` to `FALSE`.

Usage

```
.variable_arg_roles
```

Format

An object of class `tbl_df` (inherits from `tbl`, `data.frame`) with 14 rows and 7 columns.

[util_correct_variable_use\(\)](#)

[util_correct_variable_use2\(\)](#)

acc_distributions	<i>Function to plot histograms added by empirical cumulative distributions for subgroups</i>
-------------------	--

Description

Function to identify inadmissible measurements according to hard limits (multiple variables)

Usage

```
acc_distributions(  
  resp_vars = NULL,  
  label_col,  
  group_vars = NULL,  
  study_data,  
  meta_data  
)
```

Arguments

<code>resp_vars</code>	variable list the names of the measurement variables
<code>label_col</code>	variable attribute the name of the column in the metadata with labels of variables
<code>group_vars</code>	variable list the name of the observer, device or reader variable
<code>study_data</code>	data.frame the data frame that contains the measurements
<code>meta_data</code>	data.frame the data frame that contains metadata attributes of study data

Value

A [list](#) with:

- `SummaryPlots`: [list](#) of [ggplots](#) for each response variable in `resp_vars`.

ALGORITHM OF THIS IMPLEMENTATION:

- Select all variables of type float or integer in the study data
- Remove missing codes from the study data (if defined in the metadata)
- Remove measurements deviating from limits defined in the metadata
- Plot histograms
 - If group_vars is specified by the user, distributions within group-wise ecdf are presented.

acc_end_digits	<i>Extension of acc_shape_or_scale to examine uniform distributions of end digits</i>
----------------	---

Description

This implementation contrasts the empirical distribution of a measurement variables against assumed distributions. The approach is adapted from the idea of rootograms (Tukey (1977)) which is also applicable for count data (Kleiber and Zeileis (2016)).

Usage

```
acc_end_digits(resp_vars = NULL, study_data, meta_data, label_col = VAR_NAMES)
```

Arguments

resp_vars	variable the names of the measurement variables, mandatory
study_data	data.frame the data frame that contains the measurements
meta_data	data.frame the data frame that contains metadata attributes of study data
label_col	variable attribute the name of the column in the metadata with labels of variables

Value

a [list](#) with:

- SummaryData: data frame underlying the plot
- SummaryPlot: ggplot2 distribution plot comparing expected with observed distribution

ALGORITHM OF THIS IMPLEMENTATION:

- This implementation is restricted to data of type float or integer.
- Missing codes are removed from resp_vars (if defined in the metadata)
- The user must specify the column of the metadata containing probability distribution (currently only: normal, uniform, gamma)
- Parameters of each distribution can be estimated from the data or are specified by the user
- A histogram-like plot contrasts the empirical vs. the technical distribution

 acc_loess

Smoothes and plots adjusted longitudinal measurements

Description

The following R implementation executes calculations for quality indicator Unexpected distribution wrt location ([link](#)). Local regression (LOESS) is a versatile statistical method to explore an averaged course of time series measurements (Cleveland, Devlin, and Grosse 1988). In context of epidemiological data, repeated measurements using the same measurement device or by the same examiner can be considered a time series. LOESS allows to explore changes in these measurements over time.

Usage

```
acc_loess(
  resp_vars,
  group_vars,
  time_vars,
  co_vars = NULL,
  min_obs_in_subgroup,
  label_col = NULL,
  study_data,
  meta_data,
  resolution = 180,
  se_line = list(color = "red", linetype = 2),
  plot_data_time,
  plot_format = "AUTO"
)
```

Arguments

resp_vars	variable the name of the continuous measurement variable
group_vars	variable the name of the observer, device or reader variable
time_vars	variable a variable identifying the variable with the time of measurement
co_vars	variable list a vector of covariables, e.g. age and sex for adjustment. Can be NULL (default) for no adjustment.
min_obs_in_subgroup	integer from=0. optional argument if group_vars are used. This argument specifies the minimum number of observations that is required to include a subgroup (level) of the group variable named by group_vars in the analysis. Subgroups with less observations are excluded. The default is 30.
label_col	variable attribute the name of the column in the metadata with labels of variables

study_data	data.frame the data frame that contains the measurements
meta_data	data.frame the data frame that contains metadata attributes of study data
resolution	numeric how many timepoints have a standard error estimation
se_line	list standard error estimator line style, as arguments passed to <code>ggplot2::geom_line()</code>
plot_data_time	logical mark times with data values (caution, there may be many marks)
plot_format	enum AUTO COMBINED FACETS BOTH. Return the LOESS plot as a combined plot or as facets plots one per group. BOTH will return both plot variants, AUTO will decide based on the number of observers.

Details

If `plot_data_time` is not set, it will be selected based on the number of data points per group: If more than 4000 points would be plotted for at least one group, the > 4000 marks will not be plotted.

Limitations

The application of LOESS usually requires model fitting, i.e. the smoothness of a model is subject to a smoothing parameter (`span`). Particularly in the presence of interval-based missing data (USR_181), high variability of measurements combined with a low number of observations in one level of the `group_vars` the fit to the data may be distorted. Since our approach handles data without knowledge of such underlying characteristics, finding the best fit is complicated if computational costs should be minimal. The default of LOESS in R uses a `span 0.75` which provides in most cases reasonable fits. The function above increases the fit to the data automatically if the minimum of observations in one level of the `group_vars` is higher than `n=30`.

Value

a [list](#) with:

- `SummaryPlotList`: list with two plots:
 - `Loess_fits_facets`: `ggplot2` LOESS plot provides panels for each subject/object. The plot contains LOESS-smoothed curves for each level of the `group_vars`. The red dashed lines represent the confidence interval of a LOESS curve for the whole data.
 - `Loess_fits_combined`: `ggplot2` LOESS plot combines all curves into one panel and is obtained by `myloess$Loess_fits_combined`. Given a low number of levels in the `group_vars` this plot eases comparisons. However, if number increases this plot may be too crowded and unclear.

See Also

[Online Documentation](#)

acc_margins

Function to estimate marginal means, see [emmeans::emmeans](#)

Description

margins does calculations for quality indicator Unexpected distribution wrt location ([link](#)). Therefore we pursue a combined approach of descriptive and model-based statistics to investigate differences across the levels of an auxiliary variable.

CAT: Unexpected distribution w.r.t. location

Marginal means

Marginal means rests on model based results, i.e. a significantly different marginal mean depends on sample size. Particularly in large studies, small and irrelevant differences may become significant. The contrary holds if sample size is low.

Usage

```
acc_margins(
  resp_vars = NULL,
  group_vars = NULL,
  co_vars = NULL,
  threshold_type = NULL,
  threshold_value,
  min_obs_in_subgroup,
  study_data,
  meta_data,
  label_col
)
```

Arguments

`resp_vars` [variable](#) the name of the continuous measurement variable

`group_vars` [variable list](#) len=1-1. the name of the observer, device or reader variable

`co_vars` [variable list](#) a vector of covariables, e.g. age and sex for adjustment

`threshold_type` [enum](#) empirical | user | none. In case empirical is chosen a multiplier of the scale measure is used, in case of user a value of the mean or probability (binary data) has to be defined see Implementation and use of thresholds. In case of none, no thresholds are displayed and no flagging of unusual group levels is applied.

`threshold_value` [numeric](#) a multiplier or absolute value see Implementation and use of thresholds

`min_obs_in_subgroup` [integer](#) from=0. optional argument if a "group_var" is used. This argument specifies the minimum no. of observations that is required to include a subgroup (level) of the "group_var" in the analysis. Subgroups with less observations are excluded. The default is 5.

study_data	data.frame the data frame that contains the measurements
meta_data	data.frame the data frame that contains metadata attributes of study data
label_col	variable attribute the name of the column in the metadata with labels of variables

Details

Limitations

Selecting the appropriate distribution is complex. Dozens of continuous, discrete or mixed distributions are conceivable in the context of epidemiological data. Their exact exploration is beyond the scope of this data quality approach. The function above uses the help function [util_dist_selection](#) which discriminates four cases:

- continuous data
- binary data
- count data with ≤ 20 categories
- count data with > 20 categories

Nonetheless, only three different plot types are generated. The fourth case is treated as continuous data. This is in fact a coarsening of the original data but for the purpose of clarity this approach is chosen.

Value

a list with:

- SummaryTable: data frame underlying the plot
- SummaryData: data frame
- SummaryPlot: ggplot2 margins plot

        co_vars = co_vars)

## End(Not run)

```

```
acc_multivariate_outlier
```

Function to calculate and plot Mahalanobis distances

Description

A standard tool to detect multivariate outliers is the Mahalanobis distance. This approach is very helpful for the interpretation of the plausibility of a measurement given the value of another. In this approach the Mahalanobis distance is used as a univariate measure itself. We apply the same rules for the identification of outliers as in univariate outliers:

- the classical approach from Tukey: $1.5 * IQR$ from the 1st (Q_{25}) or 3rd (Q_{75}) quartile.
- the $6 * \sigma$ approach, i.e. any measurement of the Mahalanobis distance not in the interval of $\bar{x} \pm 3 * \sigma$ is considered an outlier.
- the approach from Hubert for skewed distributions which is embedded in the R package **robustbase**
- a completely heuristic approach named σ -gap.

For further details, please see the vignette for univariate outlier.

Usage

```

acc_multivariate_outlier(
  resp_vars,
  id_vars = NULL,
  label_col,
  n_rules = 4,
  study_data,
  meta_data
)

```

Arguments

resp_vars	variable list the name of the continuous measurement variables
id_vars	variable optional, an ID variable of the study data. If not specified row numbers are used.
label_col	variable attribute the name of the column in the metadata with labels of variables
n_rules	numeric from=1 to=4. the no. of rules that must be violated to classify as outlier
study_data	data.frame the data frame that contains the measurements
meta_data	data.frame the data frame that contains metadata attributes of study data

Value

a list with:

- SummaryTable: [data.frame](#) underlying the plot
- SummaryPlot: [ggplot2](#) outlier plot
- FlaggedStudyData [data.frame](#) contains the original data frame with the additional columns `tukey`, `sixsigma`, `hubert`, and `sigmagap`. Every observation is coded 0 if no outlier was detected in the respective column and 1 if an outlier was detected. This can be used to exclude observations with outliers.

ALGORITHM OF THIS IMPLEMENTATION:

- Implementation is restricted to variables of type float
- Remove missing codes from the study data (if defined in the metadata)
- The covariance matrix is estimated for all `resp_vars`
- The Mahalanobis distance of each observation is calculated $MD_i^2 = (x_i - \mu)^T \Sigma^{-1} (x_i - \mu)$
- The four rules mentioned above are applied on this distance for each observation in the study data
- An output data frame is generated that flags each outlier
- A parallel coordinate plot indicates respective outliers

List function.

acc_robust_univariate_outlier

Function to identify univariate outliers by four different approaches

Description

A classical but still popular approach to detect univariate outlier is the boxplot method introduced by Tukey 1977. The boxplot is a simple graphical tool to display information about continuous univariate data (e.g., median, lower and upper quartile). Outliers are defined as values deviating more than $1.5 \times IQR$ from the 1st (Q25) or 3rd (Q75) quartile. The strength of Tukey's method is that it makes no distributional assumptions and thus is also applicable to skewed or non mound-shaped data Marsh and Seo, 2006. Nevertheless, this method tends to identify frequent measurements which are falsely interpreted as true outliers.

A somewhat more conservative approach in terms of symmetric and/or normal distributions is the $6 * \sigma$ approach, i.e. any measurement not in the interval of $mean(x) + / - 3 * \sigma$ is considered an outlier.

Both methods mentioned above are not ideally suited to skewed distributions. As many biomarkers such as laboratory measurements represent in skewed distributions the methods above may be

insufficient. The approach of Hubert and Vandervieren 2008 adjusts the boxplot for the skewness of the distribution. This approach is implemented in several R packages such as `robustbase::mc` which is used in this implementation of `dataquieR`.

Another completely heuristic approach is also included to identify outliers. The approach is based on the assumption that the distances between measurements of the same underlying distribution should be homogeneous. For comprehension of this approach:

- consider an ordered sequence of all measurements.
- between these measurements all distances are calculated.
- the occurrence of larger distances between two neighboring measurements may than indicate a distortion of the data. For the heuristic definition of a large distance $1 * \sigma$ has been chosen.

Note, that the plots are not deterministic, because they use `ggplot2::geom_jitter`.

Usage

```
acc_robust_univariate_outlier(
  resp_vars = NULL,
  label_col,
  study_data,
  meta_data,
  exclude_roles,
  n_rules = 4,
  max_non_outliers_plot = 10000
)
```

Arguments

<code>resp_vars</code>	variable list the name of the continuous measurement variable
<code>label_col</code>	variable attribute the name of the column in the metadata with labels of variables
<code>study_data</code>	data.frame the data frame that contains the measurements
<code>meta_data</code>	data.frame the data frame that contains metadata attributes of study data
<code>exclude_roles</code>	variable roles a character (vector) of variable roles not included
<code>n_rules</code>	integer from=1 to=4. the no. of rules that must be violated to flag a variable as containing outliers. The default is 4, i.e. all.
<code>max_non_outliers_plot</code>	integer from=0. Maximum number of non-outlier points to be plot. If more points exist, a subsample will be plotted only. Note, that sampling is not deterministic.

Details

Hint: *The function is designed for unimodal data only.*

Value

a list with:

- SummaryTable: `data.frame` with the columns Variables, Mean, SD, Median, Skewness, Tukey (N), 6-Sigma (N), Hubert (N), Sigma-gap (N), Most likely (N), To low (N), To high (N) Grading
- SummaryPlotList: `ggplot` univariate outlier plots

ALGORITHM OF THIS IMPLEMENTATION:

- Select all variables of type float in the study data
- Remove missing codes from the study data (if defined in the metadata)
- Remove measurements deviating from limits defined in the metadata
- Identify outlier according to the approaches of Tukey (Tukey 1977), SixSigma (-Bakar et al. 2006), Hubert (Hubert and Vandervieren 2008), and SigmaGap (heuristic)
- A output data frame is generated which indicates the no. of possible outlier, the direction of deviations (to low, to high) for all methods and a summary score which sums up the deviations of the different rules
- A scatter plot is generated for all examined variables, flagging observations according to the no. of violated rules (step 5).

[acc_univariate_outlier](#)

acc_shape_or_scale *Function to compare observed versus expected distributions*

Description

This implementation contrasts the empirical distribution of a measurement variables against assumed distributions. The approach is adapted from the idea of rootograms (Tukey 1977) which is also applicable for count data (Kleiber and Zeileis 2016).

Usage

```
acc_shape_or_scale(  
  resp_vars,  
  dist_col,  
  guess,  
  par1,  
  par2,  
  end_digits,  
  label_col,  
  study_data,  
  meta_data  
)
```

Arguments

resp_vars	variable the name of the continuous measurement variable
dist_col	variable attribute the name of the variable attribute in meta_data that provides the expected distribution of a study variable
guess	logical estimate parameters
par1	numeric first parameter of the distribution if applicable
par2	numeric second parameter of the distribution if applicable
end_digits	logical internal use. check for end digits preferences
label_col	variable attribute the name of the column in the metadata with labels of variables
study_data	data.frame the data frame that contains the measurements
meta_data	data.frame the data frame that contains metadata attributes of study data

Value

a list with:

- SummaryData: [data.frame](#) underlying the plot
- SummaryPlot: [ggplot2](#) probability distribution plot
- SummaryTable: [data.frame](#) with the columns Variables and GRADING

ALGORITHM OF THIS IMPLEMENTATION:

- This implementation is restricted to data of type float or integer.
- Missing codes are removed from resp_vars (if defined in the metadata)
- The user must specify the column of the metadata containing probability distribution (currently only: normal, uniform, gamma)
- Parameters of each distribution can be estimated from the data or are specified by the user
- A histogram-like plot contrasts the empirical vs. the technical distribution

- SummaryPlotList: [ggplot](#) univariate outlier plots

ALGORITHM OF THIS IMPLEMENTATION:

- Select all variables of type float in the study data
- Remove missing codes from the study data (if defined in the metadata)
- Remove measurements deviating from limits defined in the metadata
- Identify outlier according to the approaches of Tukey (Tukey 1977), SixSigma (-Bakar et al. 2006), Hubert (Hubert and Vandervieren 2008), and SigmaGap (heuristic)
- A output data frame is generated which indicates the no. of possible outlier, the direction of deviations (to low, to high) for all methods and a summary score which sums up the deviations of the different rules
- A scatter plot is generated for all examined variables, flagging observations according to the no. of violated rules (step 5).

acc_varcomp

*Estimates variance components***Description**

Variance based models and intraclass correlations (ICC) are approaches to examine the impact of so-called process variables on the measurements. This implementation is model-based.

NB: The term ICC is frequently used to describe the agreement between different observers, examiners or even devices. In respective settings a good agreement is pursued. ICC-values can vary between $[-1; 1]$ and an ICC close to 1 is desired (Koo and Li 2016, Müller and Büttner 1994).

However, in multi-level analysis the ICC is interpreted differently. Please see Snijders et al. (Snijders and Bosker 1999). In this context the proportion of variance explained by respective group levels indicate an influence of (at least one) level of the respective group_vars. An ICC close to 0 is desired.

Usage

```
acc_varcomp(
  resp_vars = NULL,
  group_vars,
  co_vars = NULL,
  min_obs_in_subgroup = 30,
  min_subgroups = 5,
  label_col = NULL,
  threshold_value = 0.05,
  study_data,
  meta_data
)
```

Arguments

resp_vars	variable list the names of the continuous measurement variables
group_vars	variable list the names of the resp. observer, device or reader variables
co_vars	variable list a vector of covariables, e.g. age and sex for adjustment
min_obs_in_subgroup	integer from=0. optional argument if a "group_var" is used. This argument specifies the minimum no. of observations that is required to include a subgroup (level) of the "group_var" in the analysis. Subgroups with less observations are excluded. The default is 30.
min_subgroups	integer from=0. optional argument if a "group_var" is used. This argument specifies the minimum no. of subgroups (levels) included "group_var". If the variable defined in "group_var" has less subgroups it is not used for analysis. The default is 5.
label_col	variable attribute the name of the column in the metadata with labels of variables

threshold_value [numeric](#) from=0 to=1. a numerical value ranging from 0-1

study_data [data.frame](#) the data frame that contains the measurements

meta_data [data.frame](#) the data frame that contains metadata attributes of study data

Value

a list with:

- SummaryTable: data frame with ICCs per rvs
- ScalarValue_max_icc: maximum variance contribution value by group_vars
- ScalarValue_argmax_icc: variable with maximum variance contribution by group_vars

ALGORITHM OF THIS IMPLEMENTATION:

- This implementation is yet restricted to data of type float.
- Missing codes are removed from resp_vars (if defined in the metadata)
- Deviations from limits, as defined in the metadata, are removed
- A linear mixed-effects model is estimated for resp_vars using co_vars and group_vars for adjustment.
- An output data frame is generated for group_vars indicating the ICC.

)
```

```
## End(Not run)
```

```
as.data.frame.dataquieR_resultset
  Convert a full dataquieR report to a data.frame
```

Description

converts a [dataquieR report](#) to a [data.frame](#). Intended for use in pipelines.

Usage

```
## S3 method for class 'dataquieR_resultset'
as.data.frame(x, ...)
```

Arguments

x	dataquieR report
...	not used

Value

a [data.frame](#) with one row per indicator call, one column implementationform naming the called indicator function, one column per function argument and one additional column containing the results of each call as a list.

```
as.list.dataquieR_resultset
  Convert a full dataquieR report to a list
```

Description

converts a [dataquieR report](#) to a [list](#). Intended for use in pipelines.

Usage

```
## S3 method for class 'dataquieR_resultset'
as.list(x, ...)
```

Arguments

x	dataquieR report
...	arguments passed to pipeline_recursive_result

Value

a [list](#) with one element per indicator call. Each element is an encapsulated sub-list as described in [pipeline_recursive_result](#)

com_item_missingness *Summarize missingness columnwise (in variable)*

Description

Item-Missingness (also referred to as item nonresponse (De Leeuw et al. 2003)) describes the missingness of single values, e.g. blanks or empty data cells in a data set. Item-Missingness occurs for example in case a respondent does not provide information for a certain question, a question is overlooked by accident, a programming failure occurs or a provided answer were missed while entering the data.

Usage

```
com_item_missingness(
  study_data,
  meta_data,
  resp_vars = NULL,
  label_col,
  show_causes = TRUE,
  cause_label_df,
  include_sysmiss = NULL,
  threshold_value,
  suppressWarnings = FALSE
)
```

Arguments

study_data	data.frame the data frame that contains the measurements
meta_data	data.frame the data frame that contains metadata attributes of study data
resp_vars	variable list the name of the measurement variables
label_col	variable attribute the name of the column in the metadata with labels of variables
show_causes	logical if TRUE, then the distribution of missing codes is shown
cause_label_df	data.frame missing code table. If missing codes have labels the respective data frame must be specified here
include_sysmiss	logical Optional, if TRUE system missingness (NAs) is evaluated in the summary plot
threshold_value	numeric from=0 to=100. a numerical value ranging from 0-100
suppressWarnings	logical warn about mixed missing and jump code lists

Value

a list with:

- `SummaryTable`: data frame about item missingness per response variable
- `SummaryPlot`: ggplot2 heatmap plot, if `show_causes` was TRUE
- `ReportSummaryTable`: data frame underlying `SummaryPlot`

ALGORITHM OF THIS IMPLEMENTATION:

- Lists of missing codes and, if applicable, jump codes are selected from the metadata
- The no. of system missings (NA) in each variable is calculated
- The no. of used missing codes is calculated for each variable
- The no. of used jump codes is calculated for each variable
- Two result dataframes (1: on the level of observations, 2: a summary for each variable) are generated
- *OPTIONAL*: if `show_causes` is selected, one summary plot for all `resp_vars` is provided

See Also

[Online Documentation](#)

com_segment_missingness

Summarizes missingness for individuals in specific segments

Description**This implementation can be applied in two use cases::**

1. participation in study segments is not recorded by respective variables, e.g. a participant's refusal to attend a specific examination is not recorded.
2. participation in study segments is recorded by respective variables.

Use case (1) will be common in smaller studies. For the calculation of segment missingness it is assumed that study variables are nested in respective segments. This structure must be specified in the static metadata. The R-function identifies all variables within each segment and returns TRUE if all variables within a segment are missing, otherwise FALSE.

Use case (2) assumes a more complex structure of study data and meta data. The study data comprise so-called intro-variables (either TRUE/FALSE or codes for non-participation). The column `KEY_STUDY_SEGMENT` in the metadata is filled by variable-IDs indicating for each variable the respective intro-variable. This structure has the benefit that subsequent calculation of item missingness obtains correct denominators for the calculation of missingness rates.

Usage

```
com_segment_missingness(
  study_data,
  meta_data,
  group_vars = NULL,
  strata_vars = NULL,
  label_col,
  threshold_value,
  direction,
  exclude_roles = "process"
)
```

Arguments

study_data	data.frame the data frame that contains the measurements
meta_data	data.frame the data frame that contains metadata attributes of study data
group_vars	variable the name of a variable used for grouping, defaults to <i>NULL</i> for not grouping output
strata_vars	variable the name of a variable used for stratification, defaults to <i>NULL</i> for not grouping output
label_col	variable attribute the name of the column in the metadata with labels of variables
threshold_value	numeric from=0 to=100. a numerical value ranging from 0-100
direction	enum low high. "high" or "low", i.e. are deviations above/below the threshold critical
exclude_roles	variable roles a character (vector) of variable roles not included

Details**Implementation and use of thresholds:**

This implementation uses one threshold to discriminate critical from non-critical values. If direction is high than all values below the `threshold_value` are normal (displayed in dark blue in the plot and flagged with `GRADING = 0` in the dataframe). All values above the `threshold_value` are considered critical. The more they deviate from the threshold the displayed color shifts to dark red. All critical values are highlighted with `GRADING = 1` in the summary data frame. By default, highest values are always shown in dark red irrespective of the absolute deviation.

If direction is low than all values above the `threshold_value` are normal (displayed in dark blue, `GRADING = 0`).

Hint:

This function does not support a `resp_vars` argument but `exclude_roles` to specify variables not relevant for detecting a missing segment.

List function.

Value

a list with:

- SummaryData: data frame about segment missingness
- SummaryPlot: ggplot2 heatmap plot: a heatmap-like graphic that highlights critical values depending on the respective threshold_value and direction.

See Also

[Online Documentation](#)

com_unit_missingness *Counts all individuals with no measurements at all*

Description

This implementation examines a crude version of unit missingness or unit-nonresponse (Kalton and Kasprzyk 1986), i.e. if all measurement variables in the study data are missing for an observation it has unit missingness.

The function can be applied on stratified data. In this case strata_vars must be specified.

Usage

```
com_unit_missingness(  
  study_data,  
  meta_data,  
  id_vars = NULL,  
  strata_vars = NULL,  
  label_col  
)
```

Arguments

study_data	data.frame the data frame that contains the measurements
meta_data	data.frame the data frame that contains metadata attributes of study data
id_vars	variable list optional, a (vectorized) call of ID-variables that should not be considered in the calculation of unit- missingness
strata_vars	variable optional, a string or integer variable used for stratification
label_col	variable attribute the name of the column in the metadata with labels of variables

Details

This implementations calculates a crude rate of unit-missingness. This type of missingness may have several causes and is an important research outcome. For example, unit-nonresponse may be selective regarding the targeted study population or technical reasons such as record-linkage may cause unit-missingness.

It has to be discriminated form segment and item missingness, since different causes and mechanisms may be the reason for unit-missingness.

Hint:

This function does not support a `resp_vars` argument but `id_vars`, which have a roughly inverse logic behind: `id_vars` with values do not prevent a row from being considered missing, because an ID is the only hint for a unit that otherwise would not occur in the data at all.

List function.

Value

A list with:

- `FlaggedStudyData`: `data.frame` with id-only-rows flagged in a column `Unit_missing`
- `SummaryData`: `data.frame` with numbers and percentages of unit missingness

contradiction_functions
contradiction_functions

Description

Detect abnormalities help functions

Usage

```
contradiction_functions
```

Format

An object of class `list` of length 11.

Details

2 variables:

- `A_not_equal_B`, if $A \neq B$
- `A_greater_equal_B`, if $A \geq B$
- `A_greater_than_B`, if $A > B$
- `A_less_than_B`, if $A < B$
- `A_less_equal_B`, if $A \leq B$
- `A_present_not_B`, if $A \& \text{is.na}(B)$
- `A_present_and_B`, if $A \& \text{!(is.na}(B))$
- `A_present_and_B_levels`, if $A \& B \in \{\text{set of levels}\}$
- `A_levels_and_B_gt_value`, if $A \in \{\text{set of levels}\} \& B > \text{value}$
- `A_levels_and_B_lt_value`, if $A \in \{\text{set of levels}\} \& B < \text{value}$
- `A_levels_and_B_levels`, if $A \in \{\text{set of levels}\} \& B \in \{\text{set of levels}\}$

`contradiction_functions_descriptions`

description of the contradiction functions

Description

description of the contradiction functions

Usage

```
contradiction_functions_descriptions
```

Format

An object of class `list` of length 11.

con_contradictions *Checks user-defined contradictions in study data*

Description

This approach considers a contradiction if impossible combinations of data are observed in one participant. For example, if age of a participant is recorded repeatedly the value of age is (unfortunately) not able to decline. Most cases of contradictions rest on comparison of two variables.

Important to note, each value that is used for comparison may represent a possible characteristic but the combination of these two values is considered to be impossible. The approach does not consider implausible or inadmissible values.

Usage

```
con_contradictions(
  resp_vars = NULL,
  study_data,
  meta_data,
  label_col,
  threshold_value,
  check_table,
  summarize_categories = FALSE
)
```

Arguments

`resp_vars` [variable list](#) the name of the measurement variables

`study_data` [data.frame](#) the data frame that contains the measurements

`meta_data` [data.frame](#) the data frame that contains metadata attributes of study data

`label_col` [variable attribute](#) the name of the column in the metadata with labels of variables

`threshold_value` [numeric](#) from=0 to=100. a numerical value ranging from 0-100

`check_table` [data.frame](#) contradiction rules table. Table defining contradictions. See details for its required structure.

`summarize_categories` [logical](#) Needs a column 'tag' in the check_table. If set, a summary output is generated for the defined categories plus one plot per category.

Details

ALGORITHM OF THIS IMPLEMENTATION::

- Select all variables in the data with defined contradiction rules (static metadata column CONTRADICTIONS)
- Remove missing codes from the study data (if defined in the metadata)
- Remove measurements deviating from limits defined in the metadata

- Assign label to levels of categorical variables (if applicable)
- Apply contradiction checks on predefined sets of variables
- Identification of measurements fulfilling contradiction rules. Therefore two output data frames are generated:
 - on the level of observation to flag each contradictory value combination, and
 - a summary table for each contradiction check.
- A summary plot illustrating the number of contradictions is generated.

List function.

Value

If `summarize_categories` is FALSE: A [list](#) with:

- `FlaggedStudyData`: The first output of the contradiction function is a data frame of similar dimension regarding the number of observations in the study data. In addition, for each applied check on the variables an additional column is added which flags observations with a contradiction given the applied check.
- `SummaryTable`: The second output summarizes this information into one data frame. This output can be used to provide an executive overview on the amount of contradictions. This output is meant for automatic digestion within pipelines.
- `SummaryData`: The third output is the same as `SummaryTable` but for human readers.
- `SummaryPlot`: The fourth output visualizes summarized information of `SummaryData`.

if `summarize_categories` is TRUE, other objects are returned: one per category named by that category (e.g. "Empirical") containing a result for contradictions within that category only. Additionally, in the slot `all_checks` a result as it would have been returned with `summarize_categories` set to FALSE. Finally, a slot `SummaryData` is returned containing sums per Category and an according [ggplot](#) in `SummaryPlot`.

```

con_detection_limits *con_detection_limits*

Description

APPROACH:

Inadmissible numerical values can be of type integer or float. This implementation requires the definition of intervals in the metadata to examine the admissibility of numerical study data.

This helps identify inadmissible measurements according to hard limits (for multiple variables).

Usage

```

con_detection_limits(
  resp_vars = NULL,
  label_col,
  study_data,
  meta_data,
  limits = c("DETECTION_LIMITS", "HARD_LIMITS", "SOFT_LIMITS")
)

```

Arguments

resp_vars	variable list the name of the measurement variables
label_col	variable attribute the name of the column in the metadata with labels of variables
study_data	data.frame the data frame that contains the measurements
meta_data	data.frame the data frame that contains metadata attributes of study data
limits	enum HARD_LIMITS SOFT_LIMITS DETECTION_LIMITS. what limits from metadata to check for

Details**ALGORITHM OF THIS IMPLEMENTATION::**

- Remove missing codes from the study data (if defined in the metadata)
- Interpretation of variable specific intervals as supplied in the metadata.
- Identification of measurements outside defined limits. Therefore two output data frames are generated:
 - on the level of observation to flag each deviation, and
 - a summary table for each variable.
- A list of plots is generated for each variable examined for limit deviations. The histogram-like plots indicate respective limits as well as deviations.
- Values exceeding limits are removed in a data frame of modified study data

For [con_detection_limits](#), The default for the limits argument differs and is here "DETECTION_LIMITS"

Value

a list with:

- FlaggedStudyData [data.frame](#) related to the study data by a 1:1 relationship, i.e. for each observation is checked whether the value is below or above the limits.
- SummaryTable [data.frame](#) summarizes limit deviations for each variable.
- SummaryPlotList [list](#) of [ggplots](#) The plots for each variable are either a histogram (continuous) or a barplot (discrete).
- ModifiedStudyData [data.frame](#) If the function identifies limit deviations, the respective values are removed in ModifiedStudyData.
- ReportSummaryTable: heatmap-like data frame about limit violations

con_inadmissible_categorical

Detects variable levels not specified in metadata

Description

For each categorical variable, value lists should be defined in the metadata. This implementation will examine, if all observed levels in the study data are valid.

Usage

```

con_inadmissible_categorical(
  resp_vars = NULL,
  study_data,
  meta_data,
  label_col,
  threshold = NULL
)

```

Arguments

resp_vars	variable list the name of the measurement variables
study_data	data.frame the data frame that contains the measurements
meta_data	data.frame the data frame that contains metadata attributes of study data
label_col	variable attribute the name of the column in the metadata with labels of variables
threshold	numeric from=0 to=100. a numerical value ranging from 0-100. Not yet implemented.

Details**ALGORITHM OF THIS IMPLEMENTATION::**

- Remove missing codes from the study data (if defined in the metadata)
- Interpretation of variable specific VALUE_LABELS as supplied in the metadata.
- Identification of measurements not corresponding to the expected categories. Therefore two output data frames are generated:
 - on the level of observation to flag each undefined category, and
 - a summary table for each variable.
- Values not corresponding to defined categories are removed in a data frame of modified study data

Value

a list with:

- SummaryTable: data frame summarizing inadmissible categories with the columns:
 - Variables: variable name/label
 - OBSERVED_CATEGORIES: the categories observed in the study data
 - DEFINED_CATEGORIES: the categories defined in the metadata
 - NON_MATCHING: the categories observed but not defined
 - NON_MATCHING_N: the number of observations with categories not defined
 - GRADING: indicator TRUE/FALSE if inadmissible categorical values were observed
- ModifiedStudyData: study data having inadmissible categories removed
- FlaggedStudyData: study data having cases with inadmissible categories flagged

dataquieR_resultset_verify

Verify an object of class dataquieR_resultset

Description

stops on errors

Usage

dataquieR_resultset_verify(list_to_verify)

Arguments

list_to_verify object to be checked

Value

invisible(TRUE) – stops on errors.

DATA_TYPES

Data Types

Description

Data Types of Study Data:

In the metadata, the following entries are allowed for the [variable attribute DATA_TYPE](#):

Usage

DATA_TYPES

Format

An object of class list of length 4.

Details

- integer for integer numbers
- string for text/string/character data
- float for decimal/floating point numbers
- datetime for timepoints

Data Types of Function Arguments:

As function arguments, [dataquieR](#) uses additional type specifications:

- `numeric` is a numerical value (`float` or `integer`), but it is not an allowed `DATA_TYPE` in the metadata. However, some functions may accept `float` or `integer` for specific function arguments. This is, where we use the term `numeric`.
- `enum` allows one element out of a set of allowed options similar to [match.arg](#)
- `variable` Function arguments of this type expect a character scalar that specifies one variable using the variable identifier given in the meta data attribute `VAR_NAMES` or, if `label_col` is set, given in the meta data attribute given in that argument. Labels can easily be translated using [prep_map_labels](#)
- `variable list` Function arguments of this type expect a character vector that specifies variables using the variable identifiers given in the meta data attribute `VAR_NAMES` or, if `label_col` is set, given in the meta data attribute given in that argument. Labels can easily be translated using [prep_map_labels](#)

DATA_TYPES_OF_R_TYPE *All available data types, mapped from their respective R types*

Description

All available data types, mapped from their respective R types

Usage

DATA_TYPES_OF_R_TYPE

Format

An object of class `list` of length 13.

<code>dimensions</code>	<i>Names of DQ dimensions</i>
-------------------------	-------------------------------

Description

a vector of data quality dimensions. The supported dimensions are Completeness, Consistency and Accuracy.

Usage

`dimensions`

Format

An object of class character of length 3.

Value

Only a definition, not a function, so no return value

See Also

[Data Quality Concept](#)

DISTRIBUTIONS

All available probability distributions for [acc_shape_or_scale](#)

Description

- uniform For uniform distribution
- normal For Gaussian distribution
- GAMMA For a gamma distribution

Usage

DISTRIBUTIONS

Format

An object of class list of length 3.

dq_report

Generate a full DQ report

Description

Generate a full DQ report

Usage

```

dq_report(
  study_data,
  meta_data,
  label_col = NULL,
  ...,
  dimensions = c("Completeness", "Consistency"),
  strata_attribute,
  strata_vars,
  cores = list(mode = "socket", logging = FALSE, cpus = util_detect_cores(),
    load.balancing = TRUE),
  specific_args = list()
)

```

Arguments

study_data	data.frame the data frame that contains the measurements
meta_data	data.frame the data frame that contains metadata attributes of study data
label_col	variable attribute the name of the column in the metadata with labels of variables
...	arguments to be passed to all called indicator functions if applicable.
dimensions	dimensions Vector of dimensions to address in the report. Allowed values in the vector are Completeness, Consistency, and Accuracy. The generated report will only cover the listed data quality dimensions. Accuracy is computational expensive, so this dimension is not enabled by default. Completeness should be included, if Consistency is included, and Consistency should be included, if Accuracy is included to avoid misleading detections of e.g. missing codes as outliers, please refer to the data quality concept for more details.
strata_attribute	character variable of a variable attribute coding study segments. Values other than leaving this empty or passing KEY_STUDY_SEGMENT are not yet supported. Stratification is not yet fully supported, please use dq_report_by .
strata_vars	character name of variables to stratify the report on, such as "study_center". Not yet supported, please use dq_report_by .
cores	integer number of cpu cores to use or a named list with arguments for parallelMap::parallelStart or NULL, if parallel has already been started by the caller.
specific_args	list named list of arguments specifically for one of the called functions, the of the list elements correspond to the indicator functions whose calls should be modified. The elements are lists of arguments.

Details

See [dq_report_by](#) for a way to generate stratified or splitted reports easily.

Value

a [dataquieR_resultset](#). Can be printed creating a RMarkdown-report.

See Also

- [as.data.frame.dataquieR_resultset](#), * [as.list.dataquieR_resultset](#), * [print.dataquieR_resultset](#), * [summary.dataquieR_resultset](#)

dq_report_by	<i>Generate a stratified full DQ report</i>
--------------	---

Description

Generate a stratified full DQ report

Usage

```
dq_report_by(
  study_data,
  meta_data,
  label_col,
  meta_data_split = KEY_STUDY_SEGMENT,
  study_data_split,
  ...
)
```

Arguments

study_data	data.frame the data frame that contains the measurements
meta_data	data.frame the data frame that contains metadata attributes of study data
label_col	variable attribute the name of the column in the metadata with labels of variables
meta_data_split	variable attribute name of a meta data attribute to split the report in sections of variables, e.g. all blood- pressure. By default, reports are split by KEY_STUDY_SEGMENT if available.
study_data_split	variable Name of a study variable to stratify the report by, e.g. the study centers.
...	passed through to dq_report

```
html_dependency_vert_dt
    HTML Dependency for vertical headers in DT::datatable
```

Description

HTML Dependency for vertical headers in DT::datatable

Usage

```
html_dependency_vert_dt()
```

Value

the dependency

```
int_datatype_matrix    Function to check declared data types of metadata in study data
```

Description

Checks data types of the study data and for the data type declared in the metadata

Usage

```
int_datatype_matrix(
  resp_vars = NULL,
  study_data,
  meta_data,
  split_segments = FALSE,
  label_col,
  max_vars_per_plot = 20,
  threshold_value = 0
)
```

Arguments

resp_vars	variable the names of the measurement variables, if missing or NULL, all variables will be checked
study_data	data.frame the data frame that contains the measurements
meta_data	data.frame the data frame that contains metadata attributes of study data
split_segments	logical return one matrix per study segment
label_col	variable attribute the name of the column in the metadata with labels of variables
max_vars_per_plot	integer from=0. The maximum number of variables per single plot.
threshold_value	numeric from=0 to=100. percentage failing conversions allowed to still classify a study variable convertible.

Details

This is a preparatory support function that compares study data with associated metadata. A prerequisite of this function is that the no. of columns in the study data complies with the no. of rows in the metadata.

For each study variable, the function searches for its data type declared in static metadata and returns a heatmap like matrix indicating data type mismatches in the study data.

List function.

Value

a list with:

- SummaryTable: data frame about the applicability of each indicator function (each function in a column). its **integer** values can be one of the following four categories: 0. Non-matching datatype, 1. Matching datatype,
- SummaryPlot: **ggplot2** heatmap plot, graphical representation of SummaryTable
- DataTypePlotList: **list** of plots per (maybe artificial) segment
- ReportSummaryTable: data frame underlying SummaryPlot

Examples

```
load(system.file("extdata/meta_data.RData", package = "dataquieR"), envir =
  environment())
load(system.file("extdata/study_data.RData", package = "dataquieR"), envir =
  environment())
appmatrix <- int_datatype_matrix(study_data = study_data,
                                meta_data = meta_data,
                                label_col = LABEL)
```

```
pipeline_recursive_result
```

Function to convert a pipeline result data frame to named encapsulated lists

Description

This function converts a data frame to a recursive list structure based on columns selected for grouping

Usage

```
pipeline_recursive_result(
  call_plan_with_results,
  result_groups = setdiff(colnames(call_plan_with_results), c(NA, "results",
    "resp_vars"))
)
```

Arguments

`call_plan_with_results` [data.frame](#) result from `pipeline_vectorized`

`result_groups` [character](#) arguments to group by

Details

The data frame columns for the arguments of a certain row/computation from the calling plan translate to levels in the encapsulated list hierarchy. The order of the levels can be specified in the `result_groups` argument.

Value

a list with:

- first argument's values in `result_groups`, each containing second's argument's values as a similar list recursively

Examples

```
call_plan_with_results <- structure(list(
  resp_vars =
    c(
      "SBP_0", "DBP_0", "VO2_CAPCAT_0",
      "BSG_0"
    ), group_vars = c(
      "USR_BP_0", "USR_BP_0", "USR_VO2_0",
      "USR_BP_0"
    ), co_vars = list("SEX_0", "SEX_0", "SEX_0", "SEX_0")
),
```

```

class = "data.frame", row.names = c(
  NA,
  -4L
)
)
)
call_plan_with_results[["results"]] <-
  list(NA, 2, "Hello", ggplot2::ggplot())
result_groups <-
  colnames(call_plan_with_results)[2:(ncol(call_plan_with_results) - 1)]
pipeline_recursive_result(call_plan_with_results, result_groups)
pipeline_recursive_result(call_plan_with_results, rev(result_groups))

```

pipeline_vectorized *Call (nearly) one "Accuracy" function with many parameterizations at once automatically*

Description

This is a function to automatically call indicator functions of the "Accuracy" dimension in a vectorized manner with a set of parameterizations derived from the metadata.

Usage

```

pipeline_vectorized(
  fct,
  resp_vars = NULL,
  study_data,
  meta_data,
  label_col,
  ...,
  key_var_names,
  cores = list(mode = "socket", logging = FALSE, load.balancing = TRUE),
  variable_roles = list(resp_vars = list(VARIABLE_ROLES$PRIMARY,
    VARIABLE_ROLES$SECONDARY), group_vars = VARIABLE_ROLES$PROCESS),
  result_groups,
  use_cache = FALSE,
  compute_plan_only = FALSE
)

```

Arguments

fct	function function to call
resp_vars	variable list the name of the measurement variables, if NULL (default), all variables are used.
study_data	data.frame the data frame that contains the measurements
meta_data	data.frame the data frame that contains metadata attributes of study data
label_col	variable attribute the name of the column in the metadata with labels of variables

...	additional arguments for the function
key_var_names	character character vector named by arguments to be filled by meta data KEY_ entries as follows: c(group_vars = KEY_OBSERVER) – may be missing, then all possible combinations will be analyzed. Cannot contain resp_vars.
cores	integer number of cpu cores to use or a named list with arguments for <code>parallelMap::parallelStart</code> or NULL, if parallel has already been started by the caller.
variable_roles	list restrict each function argument (referred to by its name matching a name in <code>names(variable_roles)</code>) to variables of the role given here.
result_groups	character columns to group results to encapsulated lists or NULL receive a data frame with all call arguments and their respective results in a column 'result' – see pipeline_recursive_result
use_cache	logical set to FALSE to omit re-using already distributed study- and metadata on a parallel cluster
compute_plan_only	logical set to TRUE to omit computations and return only the compute plan filled with planned evaluations. used in pipelines.

Details

The function to call is given as first argument. All arguments of the called functions can be given here, but `pipeline_vectorized` can derive technically possible values (most of them) from the metadata, which can be controlled using the arguments `key_var_names` and `variable_roles`. The function returns an encapsulated list by default, but it can also return a `data.frame`. See also [pipeline_recursive_result](#) for these two options. The argument `use_cache` controls, whether the input data (`study_data` and `meta_data`) should be passed around, if running in parallel or being distributed beforehand to the compute nodes. All calls will be done in parallel, if possible. This can be configured, see argument `cores` below.

If the function is called in a larger framework (such as [dq_report](#)), then `compute_plan_only` controls, not to actually call functions but return a `data.frame` with parameterizations of "Accuracy" functions only. Also in such a scenario, one may want not to start and stop a cluster with entry and leaving of `pipeline_vectorized` but use an existing cluster. This can be achieved by setting the `cores` argument NULL.

Value

- if `result_groups` is set, a list with:
 - first argument's values in `result_groups`, each containing second's argument's values as a similar list recursively;
- if `result_groups` is not set, a data frame with one row per function call, all the arguments of each call in its columns and a column `results` providing the function calls' results.

Examples

```
## Not run: # really long-running example
load(system.file("extdata/study_data.RData", package = "dataquieR"))

## End(Not run)

```

```
prep_add_to_meta
```

Support function to augment metadata during data quality reporting

Description

adds an annotation to static metadata

Usage

```
prep_add_to_meta(VAR_NAMES, DATA_TYPE, LABEL, VALUE_LABELS, meta_data, ...)
```

Arguments

VAR_NAMES	character Names of the Variables to add
DATA_TYPE	character Data type for the added variables
LABEL	character Labels for these variables

VALUE_LABELS	character Value labels for the values of the variables as usually pipe separated and assigned with =: 1 = male 2 = female
meta_data	data.frame the metadata to extend
...	Further defined variable attributes, see prep_create_meta

Details

Add metadata e.g. of transformed/new variable This function is not yet considered stable, but we already export it, because it could help. Therefore, we have some inconsistencies in the formal still.

Value

a data frame with amended meta data.

prep_check_meta_names *Checks the validity of meta data w.r.t. the provided column names*

Description

This function verifies, if a data frame complies to meta data conventions and provides a given richness of meta information as specified by level.

Usage

```
prep_check_meta_names(meta_data, level, character.only = FALSE)
```

Arguments

meta_data	data.frame the data frame that contains metadata attributes of study data
level	enum level of requirement (see also VARATT_REQUIRE_LEVELS)
character.only	logical a logical indicating whether level can be assumed to be character strings.

Details

Note, that only the given level is checked despite, levels are somehow hierarchical.

Value

a logical with:

- invisible(TRUE). In case of problems with the meta data, a condition is raised (stop()).

Examples

```

prep_check_meta_names(data.frame(VAR_NAMES = 1, DATA_TYPE = 2,
                                MISSING_LIST = 3))

prep_check_meta_names(
  data.frame(
    VAR_NAMES = 1, DATA_TYPE = 2, MISSING_LIST = 3,
    LABEL = "LABEL", VALUE_LABELS = "VALUE_LABELS",
    JUMP_LIST = "JUMP_LIST", HARD_LIMITS = "HARD_LIMITS",
    KEY_OBSERVER = "KEY_OBSERVER", KEY_DEVICE = "KEY_DEVICE",
    KEY_DATETIME = "KEY_DATETIME",
    KEY_STUDY_SEGMENT = "KEY_STUDY_SEGMENT"
  ),
  RECOMMENDED
)

prep_check_meta_names(
  data.frame(
    VAR_NAMES = 1, DATA_TYPE = 2, MISSING_LIST = 3,
    LABEL = "LABEL", VALUE_LABELS = "VALUE_LABELS",
    JUMP_LIST = "JUMP_LIST", HARD_LIMITS = "HARD_LIMITS",
    KEY_OBSERVER = "KEY_OBSERVER", KEY_DEVICE = "KEY_DEVICE",
    KEY_DATETIME = "KEY_DATETIME", KEY_STUDY_SEGMENT =
      "KEY_STUDY_SEGMENT",
    DETECTION_LIMITS = "DETECTION_LIMITS", SOFT_LIMITS = "SOFT_LIMITS",
    CONTRADICTIONS = "CONTRADICTIONS", DISTRIBUTION = "DISTRIBUTION",
    DECIMALS = "DECIMALS", VARIABLE_ROLE = "VARIABLE_ROLE",
    DATA_ENTRY_TYPE = "DATA_ENTRY_TYPE",
    VARIABLE_ORDER = "VARIABLE_ORDER", LONG_LABEL =
      "LONG_LABEL", recode = "recode"
  ),
  OPTIONAL
)

# Next one will fail
try(
  prep_check_meta_names(data.frame(VAR_NAMES = 1, DATA_TYPE = 2,
                                MISSING_LIST = 3), TECHNICAL)
)

```

```

prep_clean_labels      Support function to scan variable labels for applicability

```

Description

Adjust labels in `meta_data` to be valid variable names in formulas for diverse `r` functions, such as `glm` or `lme4::lmer`.

Usage

```

prep_clean_labels(label_col, meta_data, no_dups = FALSE)

```

Arguments

label_col	character label attribute to adjust or character vector to adjust, depending on meta_data argument is given or missing.
meta_data	data.frame meta data frame: If label_col is a label attribute to adjust, this is the meta data table to process on. If missing, label_col must be a character vector with values to adjust.
no_dups	logical disallow duplicates in input or output vectors of the function, then, prep_clean_labels would call stop() on duplicated labels.

Details

Currently, labels as given by label_col arguments in the most functions are directly used in formula, so that they become natural part of the outputs, but different models expect differently strict syntax for such formulas, especially for valid variable names. prep_clean_labels removes all potentially inadmissible characters from variable names (no guarantee, that some exotic model still rejects the names, but minimizing the number of exotic characters). However, variable names are modified, may become unreadable or indistinguishable from other variable names. For the latter case, a stop call is possible, controlled by the no_dups argument.

A warning is emitted, if modifications were necessary.

Value

a data.frame with:

- if meta_data is set, a list with:
 - modified meta_data[, label_col] column
- if meta_data is not set, adjusted labels that then were directly given in label_col

Examples

```
meta_data1 <- data.frame(
  LABEL =
    c(
      "syst. Blood pressure (mmHg) 1",
      "1st heart frequency in MHz",
      "body surface (\\u33A1)"
    )
)
print(meta_data1)
print(prepare_clean_labels(meta_data1$LABEL))
meta_data1 <- prepare_clean_labels("LABEL", meta_data1)
print(meta_data1)
```

```
prep_create_meta      Support function to create data.frames of metadata
```

Description

Create a meta data frame and map names. Generally, this function only creates a `data.frame`, but using this constructor instead of calling `data.frame(..., stringsAsFactors = FALSE)`, it becomes possible, to adapt the metadata `data.frame` in later developments, e.g. if we decide to use classes for the metadata, or if certain standard names of variable attributes change. Also, a validity check is possible to implement here.

Usage

```
prep_create_meta(..., stringsAsFactors = FALSE, level, character.only = FALSE)
```

Arguments

`...` named column vectors, names will be mapped using `WELL_KNOWN_META_VARIABLE_NAMES`, if included in `WELL_KNOWN_META_VARIABLE_NAMES` can also be a data frame, then its column names will be mapped using `WELL_KNOWN_META_VARIABLE_NAMES`

`stringsAsFactors` `logical` if the argument is a list of vectors, a data frame will be created. In this case, `stringsAsFactors` controls, whether characters will be auto-converted to Factors, which defaults here always to false independent from the `default.stringsAsFactors`.

`level` `enum` level of requirement (see also `VARATT_REQUIRE_LEVELS`) set to NULL, if not a complete metadata frame is created.

`character.only` `logical` a logical indicating whether level can be assumed to be character strings.

Details

For now, this calls `data.frame`, but it already renames variable attributes, if they have a different name assigned in `WELL_KNOWN_META_VARIABLE_NAMES`, e.g. `WELL_KNOWN_META_VARIABLE_NAMES$RECODE` maps to recode in lower case.

NB: `dataquieR` exports all names from `WELL_KNOWN_META_VARIABLE_NAME` as symbols, so `RECODE` also contains "recode".

Value

a data frame with:

- meta data attribute names mapped and
- meta data checked using `prep_check_meta_names` and do some more verification about conventions, such as check for valid intervals in limits)

See Also

[WELL_KNOWN_META_VARIABLE_NAMES](#)

```
prep_datatype_from_data
```

Get data types from data

Description

Get data types from data

Usage

```
prep_datatype_from_data(resp_vars = colnames(study_data), study_data)
```

Arguments

`resp_vars` [variable](#) names of the variables to fetch the data type from the data
`study_data` [data.frame](#) the data frame that contains the measurements

Value

vector of data types

Examples

```
dataquieR::prep_datatype_from_data(cars)
```

```
prep_map_labels
```

Support function to allocate labels to variables

Description

Map variables to certain attributes, e.g. by default their labels.

Usage

```
prep_map_labels(x, meta_data = NULL, to = LABEL, from = VAR_NAMES, ifnotfound)
```

Arguments

`x` [character](#) variable names, character vector, see parameter from
`meta_data` [data.frame](#) meta data frame
`to` [character](#) variable attribute to map to
`from` [character](#) variable identifier to map from
`ifnotfound` [list](#) A list of values to be used if the item is not found: it will be coerced to a list if necessary.

Details

This function basically calls `colnames(study_data) <- meta_data$LABEL`, ensuring correct merging/joining of study data columns to the corresponding meta data rows, even if the orders differ. If a variable/study_data-column name is not found in `meta_data[[from]]` (default `from = VAR_NAMES`), either `stop` is called or, if `ifnotfound` has been assigned a value, that value is returned. See `mget`, which is internally used by this function.

The function not only maps to the LABEL column, but to can be any metadata variable attribute, so the function can also be used, to get, e.g. all HARD_LIMITS from the metadata.

Value

a character vector with:

- mapped values

Examples

```
meta_data <- prep_create_meta(
  VAR_NAMES = c("ID", "SEX", "AGE", "DOE"),
  LABEL = c("Pseudo-ID", "Gender", "Age", "Examination Date"),
  DATA_TYPE = c(DATA_TYPES$INTEGER, DATA_TYPES$INTEGER, DATA_TYPES$INTEGER,
                 DATA_TYPES$DATETIME),
  MISSING_LIST = ""
)
stopifnot(all(prepare_map_labels(c("AGE", "DOE"), meta_data) == c("Age",
                                                                "Examination Date")))
```

prep_min_obs_level	<i>Support function to identify the levels of a process variable with minimum number of observations</i>
--------------------	--

Description

utility function to subset data based on minimum number of observation per level

Usage

```
prep_min_obs_level(study_data, group_vars, min_obs_in_subgroup)
```

Arguments

`study_data` [data.frame](#) the data frame that contains the measurements

`group_vars` [variable list](#) the name grouping variable

`min_obs_in_subgroup` [integer](#) optional argument if a "group_var" is used. This argument specifies the minimum no. of observations that is required to include a subgroup (level) of the "group_var" in the analysis. Subgroups with less observations are excluded. The default is 30.

Details

This functions removes observations having less than `min_obs_in_subgroup` distinct values in a group variable, e.g. blood pressure measurements performed by an examiner having less than e.g. 50 measurements done. It displays a warning, if samples/rows are removed and returns the modified study data frame.

Value

a data frame with:

- a subsample of original data

```
prep_pmap
```

Support function for a parallel pmap

Description

parallel version of `purrr::pmap`

Usage

```
prep_pmap(.l, .f, ..., cores = 0)
```

Arguments

<code>.l</code>	data.frame with one call per line and one function argument per column
<code>.f</code>	function to call with the arguments from <code>.l</code>
<code>...</code>	additional, static arguments for calling <code>.f</code>
<code>cores</code>	number of cpu cores to use or a (named) list with arguments for parallelMap::parallelStart or <code>NULL</code> , if parallel has already been started by the caller. Set to 0 to run without parallelization.

Value

[list](#) of results of the function calls

Author(s)

[Aurèle](#)
S Struckmann

`prep_prepare_dataframes`*Prepare and verify study data with metadata*

Description

This function ensures, that a data frame `ds1` with suitable variable names `study_data` and `meta_data` exist as base [data.frames](#).

Usage

```
prep_prepare_dataframes(.study_data, .meta_data, .label_col, .replace_missings)
```

Arguments

<code>.study_data</code>	if provided, use this data set as <code>study_data</code>
<code>.meta_data</code>	if provided, use this data set as <code>meta_data</code>
<code>.label_col</code>	if provided, use this as <code>label_col</code>
<code>.replace_missings</code>	replace missing codes, defaults to TRUE

Details

This function defines `ds1` and modifies `study_data` and `meta_data` in the environment of its caller (see [eval.parent](#)). It also defines or modifies the object `label_col` in the calling environment. Almost all functions exported by `dataquieR` call this function initially, so that aspects common to all functions live here, e.g. testing, if an argument `meta_data` has been given and features really a [data.frame](#). It verifies the existence of required metadata attributes ([VARATT_REQUIRE_LEVELS](#)). It can also replace missing codes by NAs, and calls [prep_study2meta](#) to generate a minimum set of metadata from the study data on the fly (should be amended, so on-the-fly-calling is not recommended for an instructive use of `dataquieR`).

The function also detects tibbles, which are then converted to base-R [data.frames](#), which are expected by `dataquieR`.

Different from the other utility function that work in the caller's environment, so it modifies objects in the calling function. It defines a new object `ds1`, it modifies `study_data` and/or `meta_data` and `label_col`.

Value

`ds1` the study data with mapped column names

See Also

[acc_margins](#)

Examples

```

acc_test1 <- function(resp_variable, aux_variable,
                     time_variable, co_variables,
                     group_vars, study_data, meta_data) {
  prep_prepare_dataframes()
  invisible(ds1)
}
acc_test2 <- function(resp_variable, aux_variable,
                     time_variable, co_variables,
                     group_vars, study_data, meta_data, label_col) {
  ds1 <- prep_prepare_dataframes(study_data, meta_data)
  invisible(ds1)
}
environment(acc_test1) <- asNamespace("dataquieR")
# perform this inside the package (not needed for functions that have been
# integrated with the package already)

```

```
print(head(acc_test4(study_data = study_data, meta_data = meta_data,
  label_col = LABEL)))
try(acc_test2(study_data = NULL, meta_data = meta_data))
```

```
prep_study2meta      Guess a meta data frame from study data.
```

Description

Guess a minimum meta data frame from study data. Minimum required variable attributes are:

Usage

```
prep_study2meta(
  study_data,
  level = c(VARATT_REQUIRE_LEVELS$REQUIRED, VARATT_REQUIRE_LEVELS$OPTIONAL),
  convert_factors = FALSE
)
```

Arguments

study_data [data.frame](#) the data frame that contains the measurements
 level [enum](#) level to provide (see also [VARATT_REQUIRE_LEVELS](#))
 convert_factors [logical](#) convert the

Details

```
dataquieR:::util_get_var_att_names_of_level(VARATT_REQUIRE_LEVELS$REQUIRED)
#>   VAR_NAMES   DATA_TYPE  MISSING_LIST
#>   "VAR_NAMES"  "DATA_TYPE" "MISSING_LIST"
```

The function also tries to detect missing codes.

Value

a meta_data data frame

```
prep_valuelabels_from_data
```

Get value labels from data

Description

Detects factors and converts them to compatible metadata/study data.

Usage

```
prep_valuelabels_from_data(resp_vars = colnames(study_data), study_data)
```

Arguments

`resp_vars` [variable](#) names of the variables to fetch the value labels from the data
`study_data` [data.frame](#) the data frame that contains the measurements

Value

a [list](#) with:

- `VALUE_LABELS`: vector of value labels and modified study data
- `ModifiedStudyData`: study data with factors as integers

Examples

```
dataquieR::prep_datatype_from_data(iris)
```

```
print.dataquieR_result
```

Print a [dataquieR](#) result returned by pipeline_vectorized

Description

Print a [dataquieR](#) result returned by pipeline_vectorized

Usage

```
## S3 method for class 'dataquieR_result'  
print(x, ...)
```

Arguments

`x` [list](#) a dataquieR result from [pipeline_vectorized](#)
`...` passed to print. Additionally, the argument slot may be passed to print only specific sub-results.

Value

see print

Examples

```
load(system.file("extdata", "study_data.RData", package = "dataquieR"))
load(system.file("extdata", "meta_data.RData", package = "dataquieR"))
result <- pipeline_vectorized(acc_margins, cores = list(mode = "local"),
  resp_vars = "SBP_0", group_vars = "USR_BP_0",
  study_data = study_data, meta_data = meta_data, label_col = LABEL
)
single_result <- result$`group_vars = USR_BP_0`$`resp_vars = SBP_0`
print(single_result, slot = "SummaryPlot")
```

```
print.dataquieR_resultset
```

Generate a RMarkdown-based report from a [dataquieR](#) report

Description

Generate a RMarkdown-based report from a [dataquieR](#) report

Usage

```
## S3 method for class 'dataquieR_resultset'
print(x, ...)
```

Arguments

x	dataquieR report.
...	additional arguments: <ul style="list-style-type: none"> • template: Report template to use, not yet supported. • chunk_error: display error messages in report • chunk_warning: display warnings in report • output_format: output format to use, see rmarkdown::render – currently, html based formats are supported by the default template. • chunk_echo: display R code in report • chunk_message: display message outputs in report

Value

file name of the generated report

```
print.ReportSummaryTable
```

print implementation for the class ReportSummaryTable

Description

Use this function to print results objects of the class ReportSummaryTable.

Usage

```
## S3 method for class 'ReportSummaryTable'  
print(  
  x,  
  relative,  
  dt = FALSE,  
  fillContainer = FALSE,  
  displayValues = FALSE,  
  ...  
)
```

Arguments

x	an object used to select a method.
relative	logical normalize the values in each column by division by the N column.
dt	logical use DT::datatables, if installed
fillContainer	logical if dt is TRUE, control table size, see DT::datatables.
displayValues	logical if dt is TRUE, also display the actual values
...	further arguments passed to or from other methods.

Details

The default method, `print.default` has its own help page. Use `methods("print")` to get all the methods for the print generic.

`print.factor` allows some customization and is used for printing **ordered** factors as well.

`print.table` for printing **tables** allows other customization. As of R 3.0.0, it only prints a description in case of a table with 0-extents (this can happen if a classifier has no valid data).

See [noquote](#) as an example of a class whose main purpose is a specific print method.

Value

the printed object

References

Chambers, J. M. and Hastie, T. J. (1992) *Statistical Models in S*. Wadsworth & Brooks/Cole.

See Also

The default method `print.default`, and help for the methods above; further `options`, `noquote`.

For more customizable (but cumbersome) printing, see `cat`, `format` or also `write`. For a simple prototypical print method, see `.print.via.format` in package `tools`.

Examples

```
require(stats)

ts(1:20) #-- print is the "Default function" --> print.ts(.) is called
for(i in 1:3) print(1:i)

## Printing of factors
attenu$station ## 117 levels -> 'max.levels' depending on width

## ordered factors: levels "l1 < l2 < .."
esoph$agegp[1:12]
esoph$alcgp[1:12]

## Printing of sparse (contingency) tables
set.seed(521)
t1 <- round(abs(rt(200, df = 1.8)))
t2 <- round(abs(rt(200, df = 1.4)))
table(t1, t2) # simple
print(table(t1, t2), zero.print = ".") # nicer to read

## same for non-integer "table":
T <- table(t2,t1)
T <- T * (1+round(rlnorm(length(T)))/4)
print(T, zero.print = ".") # quite nicer,
print.table(T[,2:8] * 1e9, digits=3, zero.print = ".")
## still slightly inferior to Matrix::Matrix(T) for larger T

## Corner cases with empty extents:
table(1, NA) # < table of extent 1 x 0 >
```

pro_applicability_matrix

Function to check applicability of DQ functions on study data

Description

Checks applicability of DQ functions based on study data and metadata characteristics

Usage

```
pro_applicability_matrix(
  study_data,
  meta_data,
```

`rbind.ReportSummaryTable`

Combine ReportSummaryTable outputs

Description

Using this `rbind` implementation, you can combine different heatmap-like results of the class `ReportSummaryTable`.

Usage

```
## S3 method for class 'ReportSummaryTable'  
rbind(...)
```

Arguments

... `ReportSummaryTable` objects to combine.

See Also

[base::rbind.data.frame](#)

`SPLIT_CHAR`

Character used by default as a separator in meta data such as missing codes

Description

This 1 character is according to our metadata concept "I".

Usage

```
SPLIT_CHAR
```

Format

An object of class character of length 1.

`summary.dataquieR_resultset`*Summarize a [dataquieR](#) report*

Description

Summarizes a [dataquieR](#) report extracting all GRADING results.

Usage

```
## S3 method for class 'dataquieR_resultset'  
summary(object, ...)
```

Arguments

<code>object</code>	dataquieR report.
<code>...</code>	not used yet.

Value

a [data.frame](#) with one row per variable and one column per GRADING result. Each function providing a GRADING conforming to the standards is represented by a column. GRADING expresses the presence of a problem with 0 = no | 1 = yes

Examples

```
## Not run:  
# runs spuriously slow on rhub  
load(system.file("extdata/meta_data.RData", package = "dataquieR"), envir =  
  environment())  
load(system.file("extdata/study_data.RData", package = "dataquieR"), envir =  
  environment())  
report <- suppressWarnings(dq_report(  
  variables = head(meta_data[[LABEL]], 5),  
  study_data, meta_data,  
  cores = 1,  
  label_col = LABEL, dimensions =  
  c( # for sake of speed, omit Accuracy here  
    "Consistency")  
))  
x <- summary(report)  
  
## End(Not run)
```

util_anytime_installed

Test, if package anytime is installed

Description

Test, if package anytime is installed

Usage

```
util_anytime_installed()
```

Value

TRUE if anytime is installed.

See Also

[requireNamespace](#)

util_app_cd

utility function for the applicability of contradiction checks

Description

Test for applicability of contradiction checks

Usage

```
util_app_cd(x, dta)
```

Arguments

x [data.frame](#) metadata

dta [logical](#) vector, 1=matching data type, 0 = non-matching data type

Value

[factor](#) 0-3 for each variable in metadata

- 0 data type mismatch and not applicable
- 1 data type mismatches but applicable
- 2 data type matches but not applicable
- 3 data type matches and applicable

util_app_dc	<i>utility function for the applicability of of distribution plots</i>
-------------	--

Description

Test for applicability of distribution plots

Usage

```
util_app_dc(x, dta)
```

Arguments

x [data.frame](#) metadata
dta [logical](#) vector, 1=matching data type, 0 = non-matching data type

Value

[factor](#) 0-3 for each variable in metadata

- 0 data type mismatch and not applicable
- 1 data type mismatches but applicable
- 2 data type matches but not applicable
- 3 data type matches and applicable

util_app_dl	<i>utility function to test for applicability of detection limits checks</i>
-------------	--

Description

Test for applicability of detection limits checks

Usage

```
util_app_dl(x, dta)
```

Arguments

x [data.frame](#) metadata
dta [logical](#) vector, 1=matching data type, 0 = non-matching data type

Value

factor 0-3 for each variable in metadata

- 0 data type mismatch and not applicable
- 1 data type mismatches but applicable
- 2 data type matches but not applicable
- 3 data type matches and applicable

util_app_ed

utility function for the applicability of of end digits preferences checks

Description

Test for applicability of end digits preferences checks

Usage

```
util_app_ed(x, dta)
```

Arguments

x [data.frame](#) metadata

dta [logical](#) vector, 1=matching data type, 0 = non-matching data type

Value

factor 0-3 for each variable in metadata

- 0 data type mismatch and not applicable
- 1 data type mismatches but applicable
- 2 data type matches but not applicable
- 3 data type matches and applicable

util_app_iac	<i>utility function for the applicability of categorical admissibility</i>
--------------	--

Description

Test for applicability of categorical admissibility

Usage

```
util_app_iac(x, dta)
```

Arguments

x	data.frame metadata
dta	logical vector, 1=matching data type, 0 = non-matching data type

Value

[factor](#) 0-3 for each variable in metadata

- 0 data type mismatch and not applicable
- 1 data type mismatches but applicable
- 2 data type matches but not applicable
- 3 data type matches and applicable

util_app_iav	<i>utility function for the applicability of numeric admissibility</i>
--------------	--

Description

Test for applicability of numeric admissibility

Usage

```
util_app_iav(x, dta)
```

Arguments

x	data.frame metadata
dta	logical vector, 1=matching data type, 0 = non-matching data type

Value

factor 0-3 for each variable in metadata

- 0 data type mismatch and not applicable
- 1 data type mismatches but applicable
- 2 data type matches but not applicable
- 3 data type matches and applicable

util_app_im	<i>utility function applicability of item missingness</i>
-------------	---

Description

Test for applicability of item missingness

Usage

```
util_app_im(x, dta)
```

Arguments

x [data.frame](#) metadata
dta [logical](#) vector, 1=matching data type, 0 = non-matching data type

Value

factor 0-3 for each variable in metadata

- 0 data type mismatch and not applicable
- 1 data type mismatches but applicable
- 2 data type matches but not applicable
- 3 data type matches and applicable

util_app_loess	<i>utility function for applicability of LOESS smoothed time course plots</i>
----------------	---

Description

Test for applicability of LOESS smoothed time course plots

Usage

```
util_app_loess(x, dta)
```

Arguments

x	data.frame metadata
dta	logical vector, 1=matching data type, 0 = non-matching data type

Value

[factor](#) 0-3 for each variable in metadata

- 0 data type mismatch and not applicable
- 1 data type mismatches but applicable
- 2 data type matches but not applicable
- 3 data type matches and applicable

util_app_mar	<i>utility function to test for applicability of marginal means plots</i>
--------------	---

Description

Test for applicability of detection limits checks

Usage

```
util_app_mar(x, dta)
```

Arguments

x	data.frame metadata
dta	logical vector, 1 = matching data type, 0 = non-matching data type

Value

factor 0-3 for each variable in metadata

- 0 data type mismatch and not applicable
- 1 data type mismatches but applicable
- 2 data type matches but not applicable
- 3 data type matches and applicable

util_app_mol

utility function applicability of multivariate outlier detection

Description

Test for applicability of multivariate outlier detection

Usage

```
util_app_mol(x, dta)
```

Arguments

x [data.frame](#) metadata

dta [logical](#) vector, 1=matching data type, 0 = non-matching data type

Value

factor 0-3 for each variable in metadata

- 0 data type mismatch and not applicable
- 1 data type mismatches but applicable
- 2 data type matches but not applicable
- 3 data type matches and applicable

util_app_ol	<i>utility function for the applicability of outlier detection</i>
-------------	--

Description

Test for applicability of univariate outlier detection

Usage

```
util_app_ol(x, dta)
```

Arguments

x [data.frame](#) metadata
dta [logical](#) vector, 1=matching data type, 0 = non-matching data type

Value

[factor](#) 0-3 for each variable in metadata

- 0 data type mismatch and not applicable
- 1 data type mismatches but applicable
- 2 data type matches but not applicable
- 3 data type matches and applicable

util_app_sm	<i>utility function applicability of segment missingness</i>
-------------	--

Description

Test for applicability of segment missingness

Usage

```
util_app_sm(x, dta)
```

Arguments

x [data.frame](#) metadata
dta [logical](#) vector, 1=matching data type, 0 = non-matching data type

Value

factor 0-3 for each variable in metadata

- 0 data type mismatch and not applicable
- 1 data type mismatches but applicable
- 2 data type matches but not applicable
- 3 data type matches and applicable

util_app_sos	<i>utility function applicability of distribution function's shape or scale check</i>
--------------	---

Description

Test for applicability of checks for deviation from expected probability distribution shapes/scales

Usage

```
util_app_sos(x, dta)
```

Arguments

x [data.frame](#) metadata
dta [logical](#) vector, 1=matching data type, 0 = non-matching data type

Value

factor 0-3 for each variable in metadata

- 0 data type mismatch and not applicable
- 1 data type mismatches but applicable
- 2 data type matches but not applicable
- 3 data type matches and applicable

util_app_vc	<i>utility applicability variance components</i>
-------------	--

Description

Test for applicability of ICC

Usage

```
util_app_vc(x, dta)
```

Arguments

x	data.frame metadata
dta	logical vector, 1=matching data type, 0 = non-matching data type

Value

[factor](#) 0-3 for each variable in metadata

- 0 data type mismatch and not applicable
- 1 data type mismatches but applicable
- 2 data type matches but not applicable
- 3 data type matches and applicable

util_assign_levlabs	<i>utility function to assign labels to levels</i>
---------------------	--

Description

function to assign labels to levels of a variable

Usage

```
util_assign_levlabs(  
  variable,  
  string_of_levlabs,  
  splitchar,  
  assignchar,  
  ordered = TRUE  
)
```

Arguments

variable	vector vector with values of a study variable
string_of_levlabs	character len=1. value labels, e.g. 1 = no 2 = yes
splitchar	character len=1. splitting character(s) in string_of_levlabs, usually SPLIT_CHAR
assignchar	character len=1. assignment operator character(s) in string_of_levlabs, usually = or :
ordered	the function converts variable to a factor , by default to an ordered factor assuming LHS of assignments being meaningful numbers, e.g. 1 = low 2 = medium 3 = high. If no special order is given, set ordered to FALSE, e.g. for 1 = male 2 = female or 1 = low 2 = high 3 = medium.

Value

a **data.frame** with labels assigned to categorical variables (if available)

util_as_numeric *Convert factors to label-corresponding numeric values*

Description

Converts a vector factor aware of numeric values not being scrambled.

Usage

```
util_as_numeric(v, warn)
```

Arguments

v	the vector
warn	if not missing: character with error message stating conversion error

Value

the converted vector

util_backtickQuote *utility function to set string in backticks*

Description

Quote a set of variable names with backticks

Usage

```
util_backtickQuote(x)
```

Arguments

x variable names

Value

quoted variable names

util_check_data_type *Support function to verify the data type of a value*

Description

Function to verify the data type of a value.

Usage

```
util_check_data_type(  
  x,  
  type,  
  check_convertible = FALSE,  
  threshold_value = 0,  
  return_counts = FALSE  
)
```

Arguments

x the value
type expected data type
check_convertible **logical** also try, if a conversion to the declared data type would work.
threshold_value **numeric** from=0 to=100. percentage failing conversions allowed if check_convertible is TRUE.
return_counts **logical** return the counts instead of logical values about threshold violations.

Value

if check_convertible is FALSE, **logical** whether x is of the expected type if check_convertible is TRUE `` [integer] with the states 0, 1, 2: 0 = Mismatch, not convertible 1 = Match 2 = Mismatch, but convertible

util_check_one_unique_value
Check for one value only

Description

utility function to identify variables with one value only.

Usage

```
util_check_one_unique_value(x)
```

Arguments

x vector with values

Value

logical(1): TRUE, if – except NA – exactly only one value is observed in x, FALSE otherwise

util_compare_meta_with_study
Compares study data data types with the ones expected according to the metadata

Description

Utility function to compare data type of study data with those defined in metadata

Usage

```
util_compare_meta_with_study(  
  sdf,  
  mdf,  
  label_col,  
  check_convertible = FALSE,  
  threshold_value = 0  
)
```

Arguments

sdf the [data.frame](#) of study data

mdf the [data.frame](#) of associated static meta data

label_col [variable attribute](#) the name of the column in the metadata with labels of variables

check_convertible [logical](#) also try, if a conversion to the declared data type would work.

threshold_value [numeric](#) from=0 to=100. percentage failing conversions allowed if check_convertible is TRUE.

Value

if check_convertible is FALSE, a binary vector (0, 1) if data type applies, if check_convertible is TRUE`` a vector with the states 0, 1, 2: 0 = Mismatch, not convertible 1 = Match 2 = Mismatch, but convertible

util_correct_variable_use
Check referred variables

Description

This function operates in the environment of its caller (using [eval.parent](#), similar to [Function like C-Preprocessor-Macros](#)). Different from the other utility function that work in the caller's environment ([util_prepare_dataframes](#)), It has no side effects except that the argument of the calling function specified in `arg_name` is normalized (set to its default or a general default if missing, variable names being all white space replaced by NAs). It expects two objects in the caller's environment: `ds1` and `meta_data`. `meta_data` is the meta data frame and `ds1` is produced by a preceding call of [util_prepare_dataframes](#) using `meta_data` and `study_data`.

Usage

```
util_correct_variable_use(
  arg_name,
  allow_na,
  allow_more_than_one,
  allow_null,
  allow_all_obs_na,
  allow_any_obs_na,
  need_type,
  role = ""
)

util_correct_variable_use2(
  arg_name,
  allow_na,
```

```

    allow_more_than_one,
    allow_null,
    allow_all_obs_na,
    allow_any_obs_na,
    need_type,
    role = arg_name
  )

```

Arguments

arg_name **character** Name of a function argument of the caller of `util_correct_variable_use`

allow_na **logical** default = FALSE. allow NAs in the variable names argument given in `arg_name`

allow_more_than_one **logical** default = FALSE. allow more than one variable names in `arg_name`

allow_null **logical** default = FALSE. allow an empty variable name vector in the argument `arg_name`

allow_all_obs_na **logical** default = TRUE. check observations for not being all NA

allow_any_obs_na **logical** default = TRUE. check observations for being complete without any NA

need_type **character** if not NA, variables must be of data type `need_type` according to the meta data, can be a pipe (|) separated list of allowed data types. Use ! to exclude a type. See [DATA_TYPES](#) for the predefined variable types of the `dataquieR` concept.

role **character** variable-argument role. Set different defaults for all allow-arguments and `need_type` of this `util_correct_variable_use..` If given, it defines the intended use of the verified argument. For typical arguments and typical use cases, roles are predefined in `.variable_arg_roles`. The role's defaults can be overwritten by the arguments. If role is "" (default), the standards are `allow_na = FALSE`, `allow_more_than_one = FALSE`, `allow_null = FALSE`, `allow_all_obs_na = TRUE`, `allow_any_obs_na = TRUE`, and `need_type = NA`. Use `util_correct_variable_use2` for using the `arg_name` as default for role. See `.variable_arg_roles` for currently available variable-argument roles.

Details

`util_correct_variable_use` and `util_correct_variable_use2` differ only in the default of the argument `role`.

`util_correct_variable_use` and `util_correct_variable_use2` put strong effort on producing compressible error messages to the caller's caller (who is typically an end user of a `dataquieR` function).

The function ensures, that a specified argument of its caller that refers variable names (one or more as character vector) matches some expectations.

This function accesses the caller's environment!

See Also[.variable_arg_roles](#)

util_count_codes	<i>count realizations of missing codes of any class</i>
------------------	---

Description

count total numbers of any sort of missing codes (MISSING or JUMP)

Usage

```
util_count_codes(sdf, mdf, variables, list, name, warn = TRUE)
```

Arguments

sdf	study data
mdf	meta data
variables	variables
list	variable attribute JUMP_LIST or MISSING_LIST: Count which categories.
name	variable attribute the name of the column in the metadata with labels of variables
warn	logical emit warnings on non-numeric missing codes

Value

a vector with the total number of missings of the class referred by `list` per variables.

util_count_code_classes	<i>count distinct realizations of missing codes of a specific class</i>
-------------------------	---

Description

count numbers of distinct codes of class missings or of class jump jumps

Usage

```
util_count_code_classes(sdf, mdf, variables, name, list, warn = FALSE)
```

Arguments

sdf	study data
mdf	meta data
variables	variables
name	variable attribute the name of the column in the metadata with labels of variables
list	variable attribute JUMP_LIST or MISSING_LIST: Count which categories.
warn	logical emit warnings on non-numeric missing codes

Value

a vector with the number of distinct realized missing codes of the missing class referred by list per variables.

util_count_NA	<i>Support function to count number of NAs</i>
---------------	--

Description

Counts the number of NAs in x.

Usage

```
util_count_NA(x)
```

Arguments

x	object to count NAs in
---	------------------------

Value

number of NAs

util_detect_cores	<i>Detect cores</i>
-------------------	---------------------

Description

See `parallel::detectCores` for further details.

Usage

```
util_detect_cores()
```

Value

number of available CPU cores.

util_dichotomize	<i>utility function to dichotomize variables</i>
------------------	--

Description

use the meta data attribute RECODE (= "recode") to dichotomize the data

Usage

```
util_dichotomize(study_data, meta_data, label_col = VAR_NAMES)
```

Arguments

study_data	Study data including jump/missing codes as specified in the code conventions
meta_data	Meta data as specified in the code conventions
label_col	variable attribute the name of the column in the metadata with labels of variables

util_dist_selection	<i>Utility function distribution-selection</i>
---------------------	--

Description

This function differentiates the type of measurement variables.

Usage

```
util_dist_selection(measurements, meta_data)
```

Arguments

measurements	study data
meta_data	meta data, not yet used

Value

data frame with one column for each variable in study data giving IsInteger, IsMultCat and IsNCategory

IsInteger contains a guess, if the variable contains integer values or is a factor

IsMultCat contains a guess, if the variable has more than two categories, if it is categorical or ordinal

NCategory contains the number of distinct values detected for the variable

util_error	<i>Produce an error message with a useful short stack trace. Then it stops the execution.</i>
------------	---

Description

Produce an error message with a useful short stack trace. Then it stops the execution.

Usage

```
util_error(m, ..., applicability_problem = NA)
```

Arguments

m	error message or a simpleError
...	arguments for sprintf on m, if m is a character
applicability_problem	logical error indicates unsuitable resp_vars

Value

nothing, its purpose is to stop.

util_find_external_functions_in_stacktrace	<i>Find externally called function in the stack trace</i>
--	---

Description

intended use: error messages for the user

Usage

```
util_find_external_functions_in_stacktrace(
  sfs = rev(sys.frames()),
  cls = rev(sys.calls())
)
```

Arguments

sfs	reverse sys.frames to search in
cls	reverse sys.calls to search in

Value

vector of [logicals](#) stating for each index, if it had been called externally

`util_find_first_externally_called_functions_in_stacktrace`*Find first externally called function in the stack trace*

Description

intended use: error messages for the user

Usage

```
util_find_first_externally_called_functions_in_stacktrace(  
  sfs = rev(sys.frames()),  
  cls = rev(sys.calls())  
)
```

Arguments

<code>sfs</code>	reverse <code>sys.frames</code> to search in
<code>cls</code>	reverse <code>sys.calls</code> to search in

Value

reverse `sys.frames` index of first non-dataquieR function in this stack

`util_fix_rstudio_bugs` *RStudio crashes on parallel calls in some versions on Darwin based operating systems with R 4*

Description

RStudio crashes on parallel calls in some versions on Darwin based operating systems with R 4

Usage

```
util_fix_rstudio_bugs()
```

Value

invisible null

util_get_code_list *Fetch a missing code list from the metadata*

Description

get missing codes from metadata (e.g. [MISSING_LIST](#) or [JUMP_LIST](#))

Usage

```
util_get_code_list(  
  x,  
  code_name,  
  split_char = SPLIT_CHAR,  
  mdf,  
  label_col = VAR_NAMES,  
  warning_if_no_list = TRUE  
)
```

Arguments

x	variable the name of the variable to retrieve code lists for. only one variable at a time is supported, <i>not</i> vectorized!!
code_name	variable attribute JUMP_LIST or MISSING_LIST : Which codes to retrieve.
split_char	character len = 1. Character(s) used to separate different codes in the metadata, usually , as in 99999 99998 99997.
mdf	data.frame the data frame that contains metadata attributes of study data
label_col	variable attribute the name of the column in the metadata with labels of variables
warning_if_no_list	logical len = 1. If TRUE, a warning is displayed, if not missing codes are available for a variable.

Value

[numeric](#) vector of missing codes.

util_get_var_att_names_of_level

Get variable attributes of a certain provision level

Description

This function returns all variable attribute names of a certain meta data provision level or of more than one level.

Usage

```
util_get_var_att_names_of_level(level)
```

Arguments

level level(s) of requirement

Value

all matching variable attribute names

util_heatmap_1th	<i>Utility Function Heatmap with 1 Threshold</i>
------------------	--

Description

Function to create heatmap-like plot given one threshold – works for percentages for now.

Usage

```
util_heatmap_1th(
  df,
  cat_vars,
  values,
  threshold,
  right_intv,
  invert,
  cols,
  strata
)
```

Arguments

df	data.frame with data to display as a heatmap.
cat_vars	variable list len=1-2. Variables to group by. Up to 2 group levels supported.
values	variable the name of the percentage variable
threshold	numeric lowest acceptable value
right_intv	logical len=1. If FALSE (default), intervals used to define color ranges in the heatmap are closed on the left side, if TRUE on the right side, respectively.
invert	logical len=1. If TRUE, high values are better, warning colors are used for low values. FALSE works vice versa.
cols	deprecated, ignored.
strata	variable optional, the name of a variable used for stratification

Value

a [list](#) with:

- SummaryPlot: [ggplot](#) object with the heatmap

util_hubert

utility function for the outliers rule of Huber et al.

Description

function to calculate outliers according to the rule of Huber et al. This function requires the package `robustbase`

Usage

```
util_hubert(x)
```

Arguments

x [numeric](#) data to check for outliers

Value

binary vector

util_interpret_limits *Utility function to interpret mathematical interval notation*

Description

Utility function to split limit definitions into interpretable elements

Usage

```
util_interpret_limits(mdata)
```

Arguments

mdata [data.frame](#) the data frame that contains metadata attributes of study data

Value

augments metadata by interpretable limit columns

util_is_integer *Check for integer values*

Description

This function checks if a variable is integer.

Usage

```
util_is_integer(x, tol = .Machine$double.eps^0.5)
```

Arguments

x the object to test
tol precision of the detection. Values deviating more than tol from their closest integer value will not be deemed integer.

Value

TRUE or FALSE

See Also

[is.integer](#)

Copied from the documentation of [is.integer](#)

[is.integer](#) detects, if the storage mode of an R-object is integer. Usually, users want to know, if the values are integer. As suggested by [is.integer](#)'s documentation, [is.wholenumber](#) does so.

util_looks_like_missing

Check for repetitive values using the digits 8 or 9 only

Description

Values not being finite (see [is.finite](#)) are also reported as missing codes.

Usage

```
util_looks_like_missing(x, n_rules = 1)
```

Arguments

x [numeric](#) vector to test
n_rules [numeric](#) Only outlying values can be missing codes; at least n_rules rules in [acc_univariate_outlier](#) match

Value

[logical](#) indicates for each value in x , if it looks like a missing code

See Also

[acc_univariate_outlier](#)

util_make_function	<i>Make a function capturing errors and other conditions for parallelization</i>
--------------------	--

Description

Make a function capturing errors and other conditions for parallelization

Usage

```
util_make_function(fct)
```

Arguments

fct [function](#) to prepare

Value

decorated [function](#)

util_map_all	<i>Maps label column meta data on study data variable names</i>
--------------	---

Description

Maps a certain label column from the meta data to the study data frame.

Usage

```
util_map_all(label_col = VAR_NAMES, study_data, meta_data)
```

Arguments

label_col	the variable of the metadata that contains the variable names of the study data
study_data	the name of the data frame that contains the measurements
meta_data	the name of the data frame that contains metadata attributes of study data

Value

[list](#) with slot df with a study data frame with mapped column names

util_no_value_labels *Select really **numeric** variables*

Description

Reduce resp_vars to those, which are either float or integer without **VALUE_LABELS**, i.e. likely **numeric** but not a **factor**

Usage

```
util_no_value_labels(resp_vars, meta_data, label_col, warn = TRUE, stop = TRUE)
```

Arguments

resp_vars	variable list len=1-2. the name of the continuous measurement variable
meta_data	data.frame the data frame that contains metadata attributes of study data
label_col	variable attribute the name of the column in the metadata with labels of variables
warn	logical warn about removed variable names
stop	logical stop on no matching resp_var

Value

character vector of matching resp_vars.

util_observations_in_subgroups

Utility function observations in subgroups

Description

This function uses `!is.na` to count the number of non-missing observations in subgroups of the data (list) and in a set of user defined response variables. In some applications it is required that the number of observations per e.g. factor level is higher than a user-defined minimum number.

Usage

```
util_observations_in_subgroups(x, rvs)
```

Arguments

x	data frame
rvs	variable names

Value

matrix of flags

util_only_NAs	<i>identify NA-only variables</i>
---------------	-----------------------------------

Description

This utility function identifies variables with NAs values only.

Usage

```
util_only_NAs(x)
```

Arguments

x the variable to check a vector

Value

flagged binary vector

util_parse_assignments	<i>Utility function to parse assignments</i>
------------------------	--

Description

This function parses labels & level assignments in the format 1 = male | 2 = female. The function also handles m = male | f = female, but this would not match the metadata concept. The split-character can be given, if not the default from [SPLIT_CHAR](#) is to be used, but this would also violate the metadata concept.

Usage

```
util_parse_assignments(text, split_char = SPLIT_CHAR)
```

Arguments

text Text to be parsed
split_char Character separating assignments

Value

the parsed assignments as a named list

util_par_pmap *Utility function parallel version of purrr::pmap*

Description

Parallel version of `purrr::pmap`.

Usage

```
util_par_pmap(  
  .l,  
  .f,  
  ...,  
  cores = list(mode = "socket", cpus = util_detect_cores(), logging = FALSE,  
    load.balancing = TRUE),  
  use_cache = FALSE  
)
```

Arguments

<code>.l</code>	data.frame with one call per line and one function argument per column
<code>.f</code>	function to call with the arguments from <code>.l</code>
<code>...</code>	additional, static arguments for calling <code>.f</code>
<code>cores</code>	number of cpu cores to use or a (named) list with arguments for parallelMap::parallelStart or <code>NULL</code> , if parallel has already been started by the caller.
<code>use_cache</code>	logical set to <code>FALSE</code> to omit re-using already distributed study- and metadata on a parallel cluster

Value

[list](#) of results of the function calls

Author(s)

[Aurèle](#)
S Struckmann

`purrr::pmap`
[Stack Overflow post](#)

```
util_prepare_dataframes  
    util_prepare_dataframes
```

Description

This function ensures, that a data frame `ds1` with suitable variable names `study_data` and `meta_data` exist as base [data.frames](#).

Usage

```
util_prepare_dataframes(.study_data, .meta_data, .label_col, .replace_missings)
```

Arguments

<code>.study_data</code>	if provided, use this data set as <code>study_data</code>
<code>.meta_data</code>	if provided, use this data set as <code>meta_data</code>
<code>.label_col</code>	if provided, use this as <code>label_col</code>
<code>.replace_missings</code>	replace missing codes, defaults to TRUE

Details

This function defines `ds1` and modifies `study_data` and `meta_data` in the environment of its caller (see [eval.parent](#)). It also defines or modifies the object `label_col` in the calling environment. Almost all functions exported by `dataquieR` call this function initially, so that aspects common to all functions live here, e.g. testing, if an argument `meta_data` has been given and features really a [data.frame](#). It verifies the existence of required metadata attributes ([VARATT_REQUIRE_LEVELS](#)). It can also replace missing codes by NAs, and calls [prep_study2meta](#) to generate a minimum set of metadata from the study data on the fly (should be amended, so on-the-fly-calling is not recommended for an instructive use of `dataquieR`).

The function also detects tibbles, which are then converted to base-R [data.frames](#), which are expected by `dataquieR`.

Different from the other utility function that work in the caller's environment, so it modifies objects in the calling function. It defines a new object `ds1`, it modifies `study_data` and/or `meta_data` and `label_col`.

Value

`ds1` the study data with mapped column names

See Also

[acc_margins](#)

Examples

```

acc_test1 <- function(resp_variable, aux_variable,
                     time_variable, co_variables,
                     group_vars, study_data, meta_data) {
  prep_prepare_dataframes()
  invisible(ds1)
}
acc_test2 <- function(resp_variable, aux_variable,
                     time_variable, co_variables,
                     group_vars, study_data, meta_data, label_col) {
  ds1 <- prep_prepare_dataframes(study_data, meta_data)

                     label_col = LABEL)))
print(head(acc_test4(study_data = study_data, meta_data = meta_data)))

```

```
print(head(acc_test4(study_data = study_data, meta_data = meta_data,
  label_col = LABEL)))
try(acc_test2(study_data = NULL, meta_data = meta_data))
```

util_replace_codes_by_NA

Utility function to replace missing codes by NAs

Description

Substitute all missing codes in a [data.frame](#) by NA.

Usage

```
util_replace_codes_by_NA(study_data, meta_data, split_char = SPLIT_CHAR)
```

Arguments

study_data	Study data including jump/missing codes as specified in the code conventions
meta_data	Metadata as specified in the code conventions
split_char	Character separating missing codes Codes are expected to be numeric.

util_set_dQuoteString *Utility function to put strings in quotes*

Description

This function generates usual double-quotes for each element of the character vector

Usage

```
util_set_dQuoteString(string)
```

Arguments

string	Character vector
--------	------------------

Value

quoted string

util_set_size	<i>Attaches attributes about the recommended minimum absolute sizes to the plot p</i>
---------------	---

Description

Attaches attributes about the recommended minimum absolute sizes to the plot p

Usage

```
util_set_size(p, width_em = NA_integer_, height_em = NA_integer_)
```

Arguments

p	ggplot the plot
width_em	numeric len=1. the minimum width hint in em
height_em	numeric len=1. the minimum height in em

Value

p the modified plot

util_set_sQuoteString	<i>Utility function single quote string</i>
-----------------------	---

Description

This function generates usual single-quotes for each element of the character vector.

Usage

```
util_set_sQuoteString(string)
```

Arguments

string	Character vector
--------	------------------

Value

quoted string

util_sigmagap

Utility function outliers according to the rule of Huber et al.

Description

This function calculates outliers according to the rule of Huber et al.

Usage

```
util_sigmagap(x)
```

Arguments

x **numeric** data to check for outliers

Value

binary vector

util_sixsigma

Utility function for six sigma deviations rule

Description

This function calculates outliers according to the rule of six sigma deviations.

Usage

```
util_sixsigma(x)
```

Arguments

x **numeric** data to check for outliers

Value

binary vector

util_tukey	<i>Utility function Tukey outlier rule</i>
------------	--

Description

This function calculates outliers according to the rule of Tukey.

Usage

```
util_tukey(x)
```

Arguments

x [numeric](#) data to check for outliers

Value

binary vector

util_validate_known_meta	<i>Utility function verifying syntax of known metadata columns</i>
--------------------------	--

Description

This function goes through metadata columns, dataquieR supports and verifies for these, that they follow its metadata conventions.

Usage

```
util_validate_known_meta(meta_data)
```

Arguments

meta_data [data.frame](#) the data frame that contains metadata attributes of study data

Value

invisible(NULL)

util_warning	<i>Produce a warning message with a useful short stack trace.</i>
--------------	---

Description

Produce a warning message with a useful short stack trace.

Usage

```
util_warning(m, ..., applicability_problem = NA)
```

Arguments

m	warning message or a simpleWarning
...	arguments for sprintf on m, if m is a character
applicability_problem	logical warning indicates unsuitable resp_vars

Value

invisible(NULL).

util_warn_unordered	<i>Warn about a problem in varname, if x has no natural order</i>
---------------------	---

Description

Also warns, if R does not have a comparison operator for x.

Usage

```
util_warn_unordered(x, varname)
```

Arguments

x	vector of data
varname	character len=1. Variable name for warning messages

Value

invisible(NULL)

VARATT_REQUIRE_LEVELS *Requirement levels of certain metadata columns*

Description

These levels are cumulatively used by the function [prep_create_meta](#) and related in the argument level therein.

Usage

VARATT_REQUIRE_LEVELS

Format

An object of class `list` of length 5.

Details

currently available:

- 'COMPATIBILITY' = "compatibility"
- 'REQUIRED' = "required"
- 'RECOMMENDED' = "recommended"
- 'OPTIONAL' = "optional"
- 'TECHNICAL' = "technical"

VARIABLE_ROLES *Variable roles can be one of the following:*

Description

- intro a variable holding consent-data
- primary a primary outcome variable
- secondary a secondary outcome variable
- process a variable describing the measurement process

Usage

VARIABLE_ROLES

Format

An object of class `list` of length 4.

WELL_KNOWN_META_VARIABLE_NAMES

Well-known metadata column names, names of metadata columns

Description

names of the variable attributes in the meta data frame holding the names of the respective observers, devices, lower limits for plausible values, upper limits for plausible values, lower limits for allowed values, upper limits for allowed values, the variable name (column name, e.g. v0020349) used in the study data, the variable name used for processing (readable name, e.g. RR_DIAST_1) and in parameters of the QA-Functions, the variable label, variable long label, variable short label, variable data type (see also [DATA_TYPES](#)), re-code for definition of lists of event categories, missing lists and jump lists as CSV strings.

Usage

WELL_KNOWN_META_VARIABLE_NAMES

Format

An object of class `list` of length 31.

Details

all entries of this list will be mapped to the package's exported `NAMESPACE` environment directly, i.e. they are available directly by their names too:

- [VAR_NAMES](#), - [LABEL](#), - [DATA_TYPE](#), - [VALUE_LABELS](#), - [MISSING_LIST](#), - [JUMP_LIST](#), - [HARD_LIMITS](#), - [DETECTION_LIMITS](#), - [SOFT_LIMITS](#), - [CONTRADICTIONS](#), - [DISTRIBUTION](#), - [DECIMALS](#), - [DATA_ENTRY_TYPE](#), - [KEY_OBSERVER](#), - [KEY_DEVICE](#), - [KEY_DATETIME](#), - [KEY_STUDY_SEGMENT](#), - [VARIABLE_ROLE](#), - [VARIABLE_ORDER](#), - [LONG_LABEL](#), - [SOFT_LIMIT_LOW](#), - [SOFT_LIMIT_UP](#), - [HARD_LIMIT_LOW](#), - [HARD_LIMIT_UP](#), - [DETECTION_LIMIT_LOW](#), - [DETECTION_LIMIT_UP](#), - [INCL_SOFT_LIMIT_LOW](#), - [INCL_SOFT_LIMIT_UP](#), - [INCL_HARD_LIMIT_LOW](#), - [INCL_HARD_LIMIT_UP](#), - [RECODE](#)

Examples

```
print(VAR_NAMES)
```
