datetimeutils-package Utilities for Dates and Times

# Description

Index

Utilities for handling dates and times, such as selecting particular days of the week or month, formatting timestamps as required by RSS feeds, or converting timestamp representations of other software (such as 'MATLAB' and 'Excel') to R. The package is lightweight (no dependencies, pure R implementations) and relies only on R's standard classes to represent dates and times ('Date' and 'POSIXt'); it aims to provide efficient implementations, through vectorisation and the use of R's native numeric representations of timestamps where possible.

#### **Details**

Helper functions for dealing with times and dates.

## Author(s)

Enrico Schumann

Maintainer: Enrico Schumann <es@enricoschumann.net>

#### See Also

DateTimeClasses, Dates

business\_days 3

business_days	Business Days
---------------	---------------

# Description

Check whether a timestamp of class Date or POSIXt is a business day; compute past or future business days.

# Usage

```
is_businessday(x, holidays = NULL)
is_weekend(x)
previous_businessday(x, holidays = NULL, shift = -1)
prev_bday(x, holidays = NULL, shift = -1)
next_businessday(x, holidays = NULL, shift = 1)
next_bday(x, holidays = NULL, shift = 1)
```

#### **Arguments**

x a vector of class Date or POSIXct

holidays A vector of class Date, or a character vector in a format that is understood

by as.Date, or anything that can be coerced to class Date by as.Date (e.g.

POSIXt). Not supported yet.

shift integer

## **Details**

is\_weekend checks whether a given date is a Saturday or Sunday.

previous\_businessday takes a Date x and returns the last non-weekend day before. When shift is less than -1, the function evaluates to the shift-th previous day. When shift is 0, the function will return x if it is a business day, else the previous business day. next\_businessday works analogously. There are shorter-named versions next\_bday and prev\_bday.

#### Value

Logical.

## Author(s)

Enrico Schumann

#### References

B.D. Ripley and K. Hornik. Date-Time Classes. R-News, 1(2):8-12, 2001.

4 convert\_date

#### See Also

DateTimeClasses

# Examples

```
is_weekend(Sys.Date())
previous_businessday(Sys.Date())
next_businessday(Sys.Date())
```

convert\_date

Convert Various Formats to Date

## **Description**

Convert dates in external formats (e.g. from MATLAB) to Date or POSIXct.

## Usage

```
convert_date(x, type, fraction = FALSE, tz = "")
```

## **Arguments**

x numeric

type character: "excel", "matlab" and "spss"/"pspp" are supported.
fraction logical: should fractional dates (i.e. times) be used? Default is FALSE.

tz character: if fraction is TRUE, then what time zone is to be assumed? Default

is "", i.e. the local time zone.

# **Details**

Convert the numeric representation of a date to class Date. For Excel, only the Windows format is supported. Note that dates before 1 March 1900 are probably wrong since Excel considers 1900 a leap year (which it is not).

#### Value

A vector of class Date, or POSIXct if fraction is TRUE.

## Author(s)

Enrico Schumann; type spss/pspp suggested and based on a patch by J\"org Beyer

## See Also

```
as.Date, as.POSIX1t
```

convert\_tz 5

# **Examples**

```
convert_date(40000, "excel")
```

 $convert\_tz$ 

Convert a Timestamp from one Timezone to Another

## **Description**

Convert a timestamp from one timezone to another.

## Usage

```
convert_tz(datetime, from = "", to)
```

# Arguments

datetime character: YYYY-MM-DD HH:MM:SS

from the timezone of datetime. If "", the local timezone is used.

to to timezone to which datetime should be converted

## **Details**

See timezones.

Be careful: if the specified timezone does not exist on your system, the function will **not** return an error.

# Value

**POSIXct** 

## Author(s)

Enrico Schumann

## References

B.D. Ripley and K. Hornik. *Date-Time Classes*. R-News, 1(2):8–12, 2001.

#### See Also

**POSIXct** 

6 end\_of\_period

## **Examples**

end\_of\_period

Handling and Manipulating Dates and Times

## **Description**

Functions for manipulating vectors that inherit from class POSIXt or Date.

## Usage

```
is_leapyear(x)

first_of_month(x)
end_of_month(x, shift = 0L)
end_of_previous_month(x)

first_of_year(x)
end_of_year(x, shift = 0L)
end_of_previous_year(x)

end_of_quarter(x, shift = 0L)

day_of_month(x)
day_of_month(x) <- value
mday(x)
mday(x) <- value

month(x, as.character = FALSE)
year(x, as.character = FALSE)</pre>
```

# Arguments

```
x a vector of class Datevalue a vector of integers
```

guess\_datetime 7

```
shift integer as.character logical
```

#### **Details**

end\_of\_month returns the last calendar day of a given month. If shift is positive, then shift months into the future; if negative, the end of previous months. end\_of\_month(x, -1) is equivalent to end\_of\_previous\_month(x). end\_of\_year works in the same way, but for calendar years. mday is a wrapper for day\_of\_month.

#### Value

Vectors of class Date or POSIXct; or logical

## Author(s)

Enrico Schumann

#### References

```
B.D. Ripley and K. Hornik. Date-Time Classes. R-News, 1(2):8–12, 2001.
```

#### See Also

#### DateTimeClasses

Many useful functions are also in package **chron**.

# **Examples**

```
## vectorisation: x *or* shift (but not both!)
end_of_month(as.Date("2013-01-15"), shift = c(-1, 0, 1))
end_of_month(as.Date("2013-01-15") + 0:100)

day_of_month(d <- as.Date("2013-01-22"))
day_of_month(d) <- 5</pre>
```

guess\_datetime

**Guess Timestamp Format** 

## Description

Tries to convert a character vector to POSIXct.

#### Usage

8 guess\_datetime

## **Arguments**

S	character
date.only	logical: try to guess dates only (if TRUE) or times as well (if FALSE)
within	logical: ignore surrounding text? Note that trailing text is always ignored, see as.Date.
tz	character: timezone to assume for times. Default is the current timezone. See argument $tz$ in as . POSIXct
try.patterns	either NULL or a character vector. See Details and Examples.

#### **Details**

The function first coerces its argument to character. It then applies a list of patterns to each element of s. Let d be a numeric digit; then the rules are roughly those in the table below. (For the precise rules, see Examples below.)

original pattern	assumed format
dddd-dd-dd dd:dd:dd	%Y-%m-%d %H:%M:%S
dd/dd/dddd dd:dd:dd	%m/%d/%Y %H:%M:%S
dd.dd.dddd dd:dd:dd	%d.%m.%Y %H:%M:%S

The rules are followed in the given order; an element will be matched only once. If there is a match, strptime will be tried with the *assumed format* (when date.only is TRUE, as.Date will be tried). For elements that do not match any pattern or for which strptime fails, NA is returned.

Additional patterns can be specified as try.patterns. This must be a character vector with an even number of elements: the first of each pair of elements is used as the pattern in a regular expression; the second as the format string passed to strptime. See Examples.

#### Value

**POSIXct** 

#### Warning

If you know the format of a timestamp, then **do not use this function** (use strptime instead). If you have no idea at all about the format of a timestamp, then **do not use this function**.

```

10 last\_weekday

last\_weekday

Functions for Computing Days of the Week

## Description

Functions for computing a specifed day-of-week, such as 'the last Friday of October 2015'.

## Usage

## **Arguments**

x a vector of class Date (but only the YYYY-MM part is relevant)

shift a vector of integers

weekday an integer (1 is Monday, 2 is Tuesday, and so on)

period character. Currently ignored. before a Date. See also inclusive.

inclusive logical. Is before meant is 'before but including'?

n an integer

#### **Details**

last\_weekday computes the last day-of-the-week (specified as an integer 0 to 6, with Sunday being 0) in a given month, e.g. 'the last Friday'. shift moves forward (when positive) or backward (when negative) by one week; see Examples.

nth\_weekday gives the *n*-th day-of-the-week (specified as an integer 0 to 6, with Sunday being 0) of a given month, e.g. 'the second Monday'.

#### Value

Date

#### Author(s)

Enrico Schumann

#### References

## DateTimeClasses

Many useful functions are also in package chron.

month.name.de

#### **Examples**

```
## GOAL: find the third Friday in March 2013
## SOLUTION: find the last Friday in February 2013 and
## shift forward by 3 weeks
last_weekday(5, as.Date("2013-02-01"), shift = 3)
## ... or much simpler
nth_weekday(5, as.Date("2013-03-01"), 3)
```

month.name.de

Non-English Month Names and Abbreviations

## **Description**

Month names and abbreviations in languages other than English: Currently only German is supported.

## Usage

```
month.name.de
month.abb.de.din1355.1
```

## **Format**

Character vectors; encoded as UTF-8 if necessary.

#### **Details**

Character vectors, encoded as UTF-8.

month.abb.de.din1355.1 contains the abbreviations of the withdrawn DIN 1355-1, which uses "Mrz" for March.

## **Source**

```
https://de.wikipedia.org/wiki/DIN_1355-1
```

#### References

```

```

```
month.name.de
month.name.de[month(Sys.Date())]
```

nth\_day

nth_day	Compute Reference Dates	

## **Description**

Compute sequences of reference dates, such as last day of month or first day of quarter.

## Usage

## **Arguments**

timestamps: a sorted vector of Dates

period numeric or character: supported are "week", "month", "quarter", "halfyear",

"year". If numeric, period is interpreted as a month number, with January being 1. Also possible are month names, either English as in month.name or month.abb, or as defined in the current locale (see strftime format specifica-

tion "%b" and "%B").

n numeric or character: currently supported are "first" and "last". If numeric,

it will be interpreted as the *n*-th day of the period.

start Date end Date business.days logical

missing character. Not supported yet.

index logical. If TRUE, the indices (instead of actual timestamps) are returned.

#### **Details**

The function computes sequences of dates that are often used as reference dates, for instance in financial reporting: last day of the month or of the year, or a particular day of the month.

The function takes a vector of timestamps and returns a subset of these timestamps. Alternatively, a sequence of calendar days may be constructed by specifying start and end.

## Value

A vector of timestamps or, if index is TRUE, a vector of integers.

#### Author(s)

Enrico Schumann

nth\_weekday

## **Examples**

```
timestamps \leftarrow seq(from = as.Date("2001-01-01"),
                 to = as.Date("2001-04-15"),
                 by = "1 day")
nth_day(timestamps, period = "quarter", n = "last")
## [1] "2001-03-31" "2001-04-15"
nth_day(timestamps, period = "quarter", n = 10)
## [1] "2001-01-10" "2001-04-10"
nth_day(timestamps, period = "quarter", n = 1:2)
## [1] "2001-01-01" "2001-01-02" "2001-04-01" "2001-04-02"
nth_day(timestamps, period = "month", n = "last")
## [1] "2001-01-31" "2001-02-28" "2001-03-31" "2001-04-15"
nth_day(start = as.Date("2016-06-03"),
       end = as.Date("2017-08-01"),
       period = c(6, 12), n = 3
## [1] "2016-06-05" "2016-12-03" "2017-06-03"
nth_day(start = as.Date("2016-06-03"),
       end = as.Date("2017-08-01"),
       period = c("Jun", "Dec"), n = c(3, 5))
## [1] "2016-06-05" "2016-06-07" "2016-12-03" "2016-12-05"
## [5] "2017-06-03" "2017-06-05"
```

rfc822t

Format Date and Time as Described in RFC 822

## **Description**

Format a timestamp as described in RFC 822.

#### Usage

```
rfc822t(x, include.dow = TRUE)
```

# Arguments

```
x a vector that can be coerced to POSIX1t include.dow logical; include the day of the week?
```

14 roundPOSIXt

#### **Details**

Formats a timestamp as '%Y %H: %M: %S %z', possibly prepending an abbreviated day-of-week. The function ignores the current locale: day-of-week and month names are in English. The format is required for timestamps in RSS feeds.

#### Value

a character vector

## Author(s)

Enrico Schumann

## References

```
https://www.ietf.org/rfc/rfc0822.txt
https://www.rssboard.org/rss-specification
```

#### See Also

```
strftime, date
```

## **Examples**

```
rfc822t(Sys.time())
```

roundPOSIXt

Round POSIXt Objects to Specified Interval

# Description

Round POSIXt objects to specified intervals such as '5 minutes'.

#### Usage

```
roundPOSIXt(t, interval, up = FALSE)
```

#### **Arguments**

t a vector that inherits from class POSIXt

interval A character string of the form "num units", in which num is a number, and units

is sec, min, hour or day. num and units must be separated by white space.

up logical: round down (the default) or up?

## **Details**

roundPOSIXt rounds an input of class POSIXt; it returns a vector of class POSIXct.

timegrid 15

#### Value

**POSIXct** 

#### Author(s)

Enrico Schumann

#### References

B.D. Ripley and K. Hornik. *Date-Time Classes*. R-News, **1**(2):8–12, 2001.

#### See Also

DateTimeClasses

## **Examples**

```
times <- as.POSIXct("2012-03-24 22:17:27") + 1:3
roundPOSIXt(times, "10 min")
roundPOSIXt(times, "10 min", TRUE)</pre>
```

timegrid

POSIXct Time Grid

## Description

Build an equally-spaced sequence of POSIXct timestamps.

# Usage

#### **Arguments**

from a vector of length one that inherits from class POSIXt. If there from has a time-

zone attribute, it will be used for the grid.

to a vector of length one that inherits from class POSIXt

interval A character string like "num units", in which num is a number, and units is

sec, min, hour or day. num and units must be separated by white space.

exclude.weekends

logical; default is TRUE

fromHHMMSS A character vector of length one like "HHMMSS". Times-of-day earlier than HHMMSS

are excluded from the grid. The applicable timezone will be taken from the from

argument.

16 timegrid

toHHMMSS A character vector of length one like "HHMMSS". Times-of-day later than HHMMSS

are excluded from the grid. The applicable timezone will be taken from the from  $\,$ 

argument.

holidays A vector of class Date, or a character vector in a format that is understood

by as.Date, or anything that can be coerced to class Date by as.Date (eg,

POSIXt).

#### **Details**

timegrid creates an equally-spaced grid of class POSIXct.

#### Value

a vector of class POSIXct (or a character vector of length zero, in case no valid points remain)

# Author(s)

Enrico Schumann

#### References

B.D. Ripley and K. Hornik. Date-Time Classes. R-News, 1(2):8-12, 2001.

## See Also

```
strftime, date
```

tznames 17

tznames

Timezone Names

# Description

A mapping between tz database (a.k.a. Olson database) and Windows timezone names.

## Usage

```
data("tznames")
```

#### **Format**

A data frame of the following 2 variables:

Windows a character vector: the timezone names used under Windows and its applications (e.g. in Outlook calendars)

Olson a character vector of the names returned by OlsonNames

#### **Details**

The data are auto-generated from file windowsZones.xml in the Unicode Common Locale Data Repository (http://cldr.unicode.org/). See https://www.unicode.org/copyright.html and https://www.unicode.org/license.html for the terms of use.

There is no 1-to-1 mapping between names: several Olson names typically map to a single Windows name.

## Source

Unicode Common Locale Data Repository (CLDR) http://cldr.unicode.org/

#### References

See https://www.iana.org/time-zones and http://web.cs.ucla.edu/~eggert/tz/tz-link.htm for more information about the tz database.

See also OlsonNames.

A plain-text table is at https://github.com/enricoschumann/datetimeutils/blob/master/data/tznames.txt

```
str(tznames)
```
