Package 'gpbStat'

January 9, 2023

Type Package

Title Comprehensive Statistical Analysis of Plant Breeding Experiments

Version 0.4.0

Maintainer Nandan Patil <tryanother609@gmail.com>

Note Department of Genetics and Plant Breeding, University of
Agricultural Sciecnes, Dharwad.

Description Performs statistical data analysis of various Plant Breeding experiments. Contains functions for Line by Tester analysis as per Arunacha-
lam, V.(1974) <http://repository.ias.ac.in/89299/> and Diallel analysis as per Griffing, B. (1956) <https://www.publish.csiro.au/bi/pdf/BI9560463>.

alphaltc | *Line x Tester data (only Crosses) in Alpha Lattice design.*

Description

The Line x Tester data of containing only crosses laid out in Alpha Lattice design.

Usage

```
data(alphaltc)
```

Format

A data frame of five variables of 15 crosses derived from five lines and three testers.

replication four replications

block five blocks

line five inbred genotype

tester three inbred genotype

yield trait of intrest

See Also

[rcbdltc](#) ,[alphaltcchk](#) ,[rcbdltcchk](#)

Examples

```
result = ltc(alphaltc, replication, line, tester, yield, block)
```

| alphaltcchk | *Line x Tester data (Crosses and Checks) in Alpha Lattice* |

Description

The sample Line x Tester data of containing crosses and checks laid out in Alpha Lattice design. The data is composed of five lines, three testers and three checks.

Usage

```
data(alphaltcchk)
```

Format

A dataframe of six variables.

replication three replications

block six blocks

line five lines

tester three testers

check three check

yield trait of intrest

See Also

[rcbdltc](#) ,[alphaltc](#) ,[rcbdltcchk](#)

Examples

```
result = ltcchk(alphaltcchk, replication, line, tester, check, yield, block)
```

| alphaltcmt | *Line x Tester data (only Crosses) in Alpha Lattice design.* |

Description

The Line x Tester data of containing only crosses laid out in Alpha Lattice design.

Usage

```
data(alphaltcmt)
```

Format

A data frame of 15 crosses derived from five lines and three testers.

replication four replications

block five blocks

line five inbred genotype

tester three inbred genotype

hsw hundred seed weight

sh shelling per cent

gy grain yield

See Also

[rcbdltc](#) ,[alphaltcchk](#) ,[rcbdltcchk](#) ,[rcbdltcmt](#)

Examples

```
result = ltcmt(alphaltcmt, replication, line, tester, alphaltcmt[,5:7], block)
```

---

alphaltcs	*Line x Tester data (only Crosses) with single plant observations laid in Alpha Lattice design.*

Description

The Line x Tester data containing single plant observations of only crosses laid out in Alpha Lattice design.

Usage

```
data(alphaltcs)
```

Format

A data frame of 15 crosses derived from five lines and three testers.

replication four replications

block five blocks

line five inbred genotype

tester three inbred genotype

obs four single plant observations

yield yield as a dependent trait

See Also

[rcbdltcs](#) ,[alphaltcchk](#) ,[rcbdltcchk](#) ,[rcbdltcmt](#)

Examples

```
result = ltcs(alphaltcs, replication, line, tester, obs, yield, block)
```

---

dm2	*Analysis of Diallel Method 2 data containing only Crosses laid out in RCBD or Alpha Lattice design.*

Description

Analysis of Diallel Method 2 data containing only Crosses laid out in RCBD or Alpha Lattice design.

Usage

```
dm2(data, rep, parent1, parent2, var, block)
```

Arguments

data	dataframe containing following variables
rep	replication
parent1	parent 1
parent2	parent 2
var	trait of interest
block	block (for alpha lattice only)

Details

Analyzing the Diallel Method 2 data containing only crosses which are evaluated in RCBD & Alpha lattice design. All the factors are considered as fixed.

Value

Means	Two way mean table.
ANOVA	ANOVA for the given variable.
Coefficient of Variation	
	Coefficient of Variation of the variable.
Diallel ANOVA	Diallel ANVOA for the given trait.
Genetic Variance	
	GCA & SCA varaince.
Combining ability effects	
	Two way table containing Combining ability effects of parents and crosses

`Standard Error`   Standard Errror for comining ability effects.

`Critical Difference`

Critical Difference at 5 pecent for combining ability effects.

Note

The blocks are mentioned at end of the function if the experimental design is Alpha Lattice. For RCBD no need mention the blocks.

Examples

```
## Not run: #Diallel Method 2 analysis containing only crosses in RCBD.
library(gpbStat)
data(dm2rcbd)
result1 =  dm2(dm2rcbd, rep, parent1, parent2, DTP)
result1

#Diallel Method 2 analysis containing only crosses in Alpha Lattice
library(gpbStat)
data(dm2alpha)
result2 =  dm2(dm2alpha, replication, parent1, parent2, TW, block)
result2

# Save results to csv file
lapply(result2, function(x) write.table(data.frame(x), 'result2.csv' , append= T, sep=','))

## End(Not run)
```

---

dm2alpha   *Diallel Method 2 data in Alpha Lattice.*

Description

The Diallel Method 2 data laid out in Alpha Lattice Design.

Usage

```
data(dm2alpha)
```

Format

A data frame for Diallel analysis Method 2 containing 105 crosses and 15 parents.

replication two replications

block twelve blocks

parent1 fifteen inbred genotype

parent2 fifteen inbred genotype

TW data for test weight

See Also

[alphaltcchk](#) ,[alphaltc](#) ,[rcbdltcchk](#) ,[dm2rcbd](#)

Examples

```
result2 =  dm2(dm2alpha, replication, parent1, parent2, TW, block)
```

---

dm2rcbd   *Diallel Method 2 data in RCBD*

Description

The Diallel Method 2 data laid out in Randomized Complete Block Design (RCBD).

Usage

```
data(rcbdltc)
```

Format

A data frame for Diallel analysis Method 2 containing four variables of 105 crosses and 15 parents.

rep four replications

parent1 five inbred genotype

parent2 three inbred genotype

DTP data for days to pollen shed

See Also

[alphaltcchk](#) ,[alphaltc](#) ,[rcbdltcchk](#) ,[dm2alpha](#)

Examples

```
result2 =  dm2(dm2rcbd, rep, parent1, parent2, DTP)
```

---

ltc	*Analysis of Line x Tester data containing only Crosses laid out in RCBD or Alpha Lattice design.*

Description

Analysis of Line x Tester data containing only Crosses laid out in RCBD or Alpha Lattice design.

Usage

```
ltc(data, replication, line, tester, y, block)
```

Arguments

data	dataframe containing following variables
replication	replication
line	line
tester	tester
y	trait of interest
block	block (for alpha lattice design only)

Details

Analyzing the line by tester data only using the data from crosses which are evaluated in alpha lattice design. All the factors are considered as fixed.

Value

Overall ANOVA   ANOVA with all the factors.
Coefficient of Variation
                 ANOVA with all the factors.
Genetic Variance
                 Phenotypic and Genotypic variance for the given trait.
Genetic Variability
                 Phenotypic coefficient of variability and Genotypic coefficient of variability and
                 Environmental coefficient of Variation.
Proportional Contribution
                 Propotional contribution of Lines, Tester and Line x Tester interaction.

`GCA lines`	Combining ability effects of lines.
`GCA testers`	Combining ability effects of testers.
`SCA crosses`	Combining ability effects of crosses
`Line x Tester ANOVA`	
	ANOVA with all the factors.
`GV Singh & Chaudhary`	
	Genetic component of Variance as per Singh and Chaudhary, 1977.
`Standard Errors`	
	Standard error for combining ability effects.
`Critical Difference`	
	Critical Difference at 5 pecent for combining ability effects.

Note

The block variable is inserted at the last if the experimental design is Alpha Lattice. For RCBD no need to have block factor.

ltcchk	*Analysis of Line x Tester data containing crosses and checks laid out in RCBD or Alpha Lattice experimental design.*

Description

Analysis of Line x Tester data containing crosses and checks laid out in RCBD or Alpha Lattice experimental design.

Usage

```
ltcchk(data, replication, line, tester, check, y, block)
```

Arguments

data	dataframe containing following variables
replication	replication variable
line	line variable
tester	tester variable
check	check variable
y	trait of interest
block	block variable (for alpha lattice design only)

Details

Analyzing the line by tester data only using the data from crosses which are evaluated in alpha lattice design. All the factors are considered as fixed.

ltcmt	*Analysis of Line x Tester data for multiple traits containing only Crosses laid out in RCBD or Alpha Lattice design.*

Description

Analysis of Line x Tester data for multiple traits containing only Crosses laid out in RCBD or Alpha Lattice design.

Usage

```
ltcmt(data, replication, line, tester, traits, block)
```

Arguments

data	dataframe containing following variables
replication	replication
line	line
tester	tester
traits	multiple traits of interest
block	block (for alpha lattice design only)

Details

Analyzing the line by tester data of multiple trais only using the data from crosses which are evaluated in RCBD and Alpha lattice design. All the factors are considered as fixed.

Value

Mean	Table of means.
ANOVA	ANOVA with all the factors.
GCA.Line	GCA effects of lines.
GCA.Tester	GCA effects of testers.
SCA	SCA effects of crosses.
CV	Coefficent of Variation.
Genetic.Variance.Covariance	
	Genetic component Variance and covariance.
Std.Error	Standard error for combining ability effects.
C.D.	Critical Difference at 5 pecent for combining ability effects.
Add.Dom.Var	Additive and Dominance component of Variance.
Contribution.of.Line.Tester	
	Contribution of Lines, Testers and Line x Tester towards total variation.

Note

The block variable is inserted at the last if the experimental design is Alpha Lattice. For RCBD no need to have block factor.

ltcs	*Analysis of Line x Tester data on single plant basis containing only Crosses laid out in RCBD or Alpha Lattice design.*

Description

Analysis of Line x Tester data on single plant basis containing only Crosses laid out in RCBD or Alpha Lattice design.

Usage

```
ltcs(data, replication, line, tester, obs, y, block)
```

Arguments

`data`	dataframe containing following variables
`replication`	replication
`line`	line
`tester`	tester
`obs`	single plant observations
`y`	dependent variable
`block`	block (for alpha lattice design only)

Details

Analyzing the line by tester data single plant observations evaluated in RCBD and Alpha lattice design. All the factors are considered as fixed.

Value

`Mean`	Table of means.
`ANOVA`	ANOVA with all the factors.
`GCA.Line`	GCA effects of lines.
`GCA.Tester`	GCA effects of testers.
`SCA`	SCA effects of crosses.
`CV`	Coeffcient of Variation.
`Std.Error`	Standard error for combining ability effects.
`C.D.`	Critical Difference at 5 pecent for combining ability effects.
`Contribution.of.Line.Tester`	
	Contribution of Lines, Testers and Line x Tester towards total variation.

Note

The block variable is inserted at the last if the experimental design is Alpha Lattice. For RCBD no need to have block factor.

rcbdltc   *Line x Tester data in RCBD*

Description

The sample Line x Tester data containing only crosses laid out in Randomized Complete Block Design (RCBD).

Usage

```
data(rcbdltc)
```

Format

A data frame of four variables of 15 crosses derived from five lines and three testers.

replication four replications

line five inbred genotype

tester three inbred genotype

yield trait of intrest

See Also

alphaltcchk ,alphaltc ,rcbdltcchk

Examples

```
 result = ltc(rcbdltc, replication, line, tester, yield)
```

---

rcbdltcchk   *Line x Tester data (Crosses and Checks) in RCBD*

Description

The sample Line x Tester data of containing crosses and checks laid out in Randomized Complete Block Design (RCBD). The data is composed of five lines, three testers and three checks.

Usage

```
data(rcbdltcchk)
```

Format

A dataframe of six variables.

replication four replications

line five lines

tester three testers

yield trait of intrest

See Also
