annotate_circle

annotate concentric circles

Description

annotate concentric circles

Usage

```
annotate_circle(cent, col = "#00BFFF", format = "", pos = "top", text_size = 3)
```

Arguments

cent centrality scores used for layout

col color of text

format either empty string or 'scientific'
pos position of text ('top' or 'bottom')

text_size font size for annotations

Details

this function is best used with layout_with_centrality together with draw_circle.

Value

annotated concentric circles around origin

draw_circle 3

Examples

```
library(igraph)
library(ggraph)

g <- sample_gnp(10,0.4)

## Not run:
ggraph(g,layout = "centrality",centrality = closeness(g))+
    draw_circle(use = "cent")+
    annotate_circle(closeness(g),pos = "bottom",format = "scientific")+
    geom_edge_link()+
    geom_node_point(shape=21,fill="grey25",size=5)+
    theme_graph()+
    coord_fixed()

## End(Not run)</pre>
```

draw_circle

Draw concentric circles

Description

Draw concentric circles

Usage

```
draw_circle(col = "#00BFFF", use = "focus", max.circle)
```

Arguments

col color of circles

use one of 'focus' or 'cent'

max.circle if use = 'focus' specifies the number of circles to draw

Details

this function is best used with a concentric layout such as layout_with_focus and layout_with_centrality.

Value

concentric circles around origin

```
library(igraph)
library(ggraph)
g <- sample_gnp(10,0.4)
## Not run:</pre>
```

4 graph_manipulate

```
ggraph(g,layout = "centrality",centrality = degree(g))+
  draw_circle(use = "cent")+
  geom_edge_link()+
  geom_node_point(shape = 21,fill = "grey25",size = 5)+
  theme_graph()+
  coord_fixed()
## End(Not run)
```

graph_manipulate

Manipulate graph

Description

functions to manipulate a graph

Usage

```
reorder_edges(g, attr, desc = TRUE)
```

Arguments

g igraph object

attr edge attribute name used to sort edges

desc logical. sort in descending (default) or ascending order

Details

reorder_edges() allows to reorder edges according to an attribute so that edges are drawn in the given order.

Value

manipulated graph

Author(s)

David Schoch

```
library(igraph)
library(ggraph)

g <- sample_gnp(10,0.5)
E(g)$attr <- 1:ecount(g)
gn <- reorder_edges(g,"attr")</pre>
```

layout_backbone 5

layout_backbone	backbone graph layout	

Description

emphasizes a hidden group structure if it exists in the graph. Calculates a layout for a sparsified network only including the most embedded edges. Deleted edges are added back after the layout is calculated.

Usage

```
layout_as_backbone(g, keep = 0.2, backbone = TRUE)
layout_igraph_backbone(g, keep = 0.2, backbone = TRUE, circular)
```

Arguments

		1
σ	igraph	object
5	1514111	object

keep fraction of edges to keep during backbone calculation backbone logical. Return edge ids of the backbone (Default: TRUE)

circular not used

Details

The layout_igraph_* function should not be used directly. It is only used as an argument for plotting with 'igraph'. 'ggraph' natively supports the layout.

Value

list of xy coordinates and vector of edge ids included in the backbone

References

Nocaj, A., Ortmann, M., & Brandes, U. (2015). Untangling the hairballs of multi-centered, smallworld online social media networks. Journal of Graph Algorithms and Applications: JGAA, 19(2), 595-618.

```
library(igraph)

g <- sample_islands(9,20,0.4,9)
g <- simplify(g)

V(g)$grp <- as.character(rep(1:9,each=20))
bb <- layout_as_backbone(g,keep=0.4)

# add backbone links as edge attribute
E(g)$col <- FALSE</pre>
```

6 layout_centrality

```
E(g)$col[bb$backbone] <- TRUE</pre>
```

layout_centrality

radial centrality layout

Description

arranges nodes in concentric circles according to a centrality index.

Usage

```
layout_with_centrality(
  g,
  cent,
  scale = TRUE,
 iter = 500,
  tol = 1e-04,
  tseq = seq(0, 1, 0.2)
)
layout_igraph_centrality(
 g,
 cent,
 scale = TRUE,
 iter = 500,
  tol = 1e-04,
  tseq = seq(0, 1, 0.2),
  circular
)
```

Arguments

g	igraph object
cent	centrality scores
scale	logical. should centrality scores be scaled to $[0, 100]$? (Default: TRUE)
iter	number of iterations during stress optimization
tol	stopping criterion for stress optimization
tseq	numeric vector. increasing sequence of coefficients to combine regular stress and constraint stress. See details.
circular	not used

Details

The function optimizes a convex combination of regular stress and a constrained stress function which forces nodes to be arranged on concentric circles. The vector tseq is the sequence of parameters used for the convex combination. In iteration i of the algorithm tseq[i] is used to combine regular and constraint stress as $(1-tseq[i])*stress_{regular}+tseq[i]*stress_{constraint}$. The sequence must be increasing, start at zero and end at one. The default setting should be a good choice for most graphs.

The layout_igraph_* function should not be used directly. It is only used as an argument for plotting with 'igraph'. 'ggraph' natively supports the layout.

Value

matrix of xy coordinates

References

Brandes, U., & Pich, C. (2011). More flexible radial layout. Journal of Graph Algorithms and Applications, 15(1), 157-173.

See Also

layout_centrality_group

Examples

```
library(igraph)
library(ggraph)

g <- sample_gnp(10,0.4)
## Not run:
ggraph(g,layout="centrality",centrality = closeness(g))+
    draw_circle(use = "cent")+
    geom_edge_link0()+
    geom_node_point(shape = 21,fill = "grey25",size = 5)+
    theme_graph()+
    coord_fixed()
## End(Not run)</pre>
```

layout_centrality_group

radial centrality group layout

Description

arranges nodes in concentric circles according to a centrality index and keeping groups within a angle range

Usage

```
layout_with_centrality_group(g, cent, group, shrink = 10, ...)
layout_igraph_centrality_group(g, cent, group, shrink = 10, circular, ...)
```

Arguments

g igraph object cent centrality scores

group vector indicating grouping of nodes

shrink shrink the reserved angle range for a group to increase the gaps between groups additional arguments to layout_with_centrality The layout_igraph_* function

should not be used directly. It is only used as an argument for plotting with

'igraph'. 'ggraph' natively supports the layout.

circular not used

Value

matrix of xy coordinates

See Also

layout_centrality

Examples

library(igraph)

layout_constrained_stress

constrained stress layout

Description

force-directed graph layout based on stress majorization with variable constrained

Usage

```
layout_with_constrained_stress(
   g,
   coord,
   fixdim = "x",
   weights = NA,
   iter = 500,
   tol = 1e-04,
   mds = TRUE,
```

```
bbox = 30
)

layout_igraph_constrained_stress(
    g,
    coord,
    fixdim = "x",
    weights = NA,
    iter = 500,
    tol = 1e-04,
    mds = TRUE,
    bbox = 30,
    circular
)
```

Arguments

g	igraph object
coord	numeric vector. fixed coordinates for dimension specified in fixdim.
fixdim	string. which dimension should be fixed. Either "x" or "y".
weights	possibly a numeric vector with edge weights. If this is NULL and the graph has a weight edge attribute, then the attribute is used. If this is NA then no weights are used (even if the graph has a weight attribute). By default, weights are ignored. See details for more.
iter	number of iterations during stress optimization
tol	stopping criterion for stress optimization
mds	should an MDS layout be used as initial layout (default: TRUE)
bbox	constrain dimension of output. Only relevant to determine the placement of disconnected graphs
circular	not used

Details

Be careful when using weights. In most cases, the inverse of the edge weights should be used to ensure that the endpoints of an edges with higher weights are closer together (weights=1/E(g)\$weight).

The layout_igraph_* function should not be used directly. It is only used as an argument for plotting with 'igraph'. 'ggraph' natively supports the layout.

Value

matrix of xy coordinates

Gansner, E. R., Koren, Y., & North, S. (2004). Graph drawing by stress majorization. *In International Symposium on Graph Drawing* (pp. 239-250). Springer, Berlin, Heidelberg.

See Also

layout_constrained_stress3D

```
{\it layout\_constrained\_stress3D} \\ {\it constrained stress layout in 3D}
```

Description

force-directed graph layout based on stress majorization with variable constrained in 3D

Usage

```
layout_with_constrained_stress3D(
   g,
   coord,
   fixdim = "x",
   weights = NA,
   iter = 500,
   tol = 1e-04,
   mds = TRUE,
   bbox = 30
)
```

Arguments

coord	numeric vector. fixed coordinates for dimension specified in fixdim.
fixdim	string. which dimension should be fixed. Either "x", "y" or "z".
weights	possibly a numeric vector with edge weights. If this is NULL and the graph has a weight edge attribute, then the attribute is used. If this is NA then no weights are used (even if the graph has a weight attribute). By default, weights are ignored. See details for more.
iter	number of iterations during stress optimization
tol	stopping criterion for stress optimization
mds	should an MDS layout be used as initial layout (default: TRUE)
bbox	constrain dimension of output. Only relevant to determine the placement of disconnected graphs

Details

Be careful when using weights. In most cases, the inverse of the edge weights should be used to ensure that the endpoints of an edges with higher weights are closer together (weights=1/E(g)\$weight).

This function does not come with direct support for igraph or ggraph.

layout_dynamic 11

Value

matrix of xyz coordinates

References

Gansner, E. R., Koren, Y., & North, S. (2004). Graph drawing by stress majorization. *In International Symposium on Graph Drawing* (pp. 239-250). Springer, Berlin, Heidelberg.

See Also

layout_constrained_stress

layout_dynamic	dynamic graph layout	

Description

Create layouts for longitudinal networks.

Usage

```
layout_as_dynamic(gList, weights = NA, alpha = 0.5, iter = 500, tol = 1e-04)
```

Arguments

gList	list of igraph objects. Each network must contain the same set of nodes.
weights	possibly a numeric vector with edge weights. If this is NULL and the graph has a weight edge attribute, then the attribute is used. If this is NA then no weights are used (even if the graph has a weight attribute). By default, weights are ignored. See details for more.
alpha	weighting of reference layout. See details.
iter	number of iterations during stress optimization
tol	stopping criterion for stress optimization

Details

The reference layout is calculated based on the union of all graphs. The parameter alpha controls the influence of the reference layout. For alpha=1, only the reference layout is used and all graphs have the same layout. For alpha=0, the stress layout of each individual graph is used. Values in-between interpolate between the two layouts.

Be careful when using weights. In most cases, the inverse of the edge weights should be used to ensure that the endpoints of an edges with higher weights are closer together (weights=1/E(g)\$weight).

Value

list of coordinates for each graph

12 layout_focus

References

Brandes, U. and Indlekofer, N. and Mader, M. (2012). Visualization methods for longitudinal social networks and stochastic actor-oriented modeling. *Social Networks* 34 (3) 291-308

Examples

```
library(igraph)
g1 <- sample_gnp(20,0.2)
g2 <- sample_gnp(20,0.2)
g3 <- sample_gnp(20,0.2)

xy <- layout_as_dynamic(list(g1,g2,g3))
# layout for first network
xy[[1]]</pre>
```

layout_focus

radial focus layout

Description

arrange nodes in concentric circles around a focal node according to their distance from the focus.

Usage

```
layout_with_focus(g, v, weights = NA, iter = 500, tol = 1e-04)
layout_igraph_focus(g, v, weights = NA, iter = 500, tol = 1e-04, circular)
```

Arguments

g	igraph object
V	id of focal node to be placed in the center
weights	possibly a numeric vector with edge weights. If this is NULL and the graph has a weight edge attribute, then the attribute is used. If this is NA then no weights are used (even if the graph has a weight attribute). By default, weights are ignored. See details for more.
iter	number of iterations during stress optimization

iter number of iterations during stress optimizationtol stopping criterion for stress optimization

circular not used

Details

Be careful when using weights. In most cases, the inverse of the edge weights should be used to ensure that the endpoints of an edges with higher weights are closer together (weights=1/E(g)\$weight).

layout_focus_group 13

Value

a list containing xy coordinates and the distances to the focal node

References

Brandes, U., & Pich, C. (2011). More flexible radial layout. *Journal of Graph Algorithms and Applications*, 15(1), 157-173.

See Also

layout_focus_group The layout_igraph_* function should not be used directly. It is only used as an argument for plotting with 'igraph'. 'ggraph' natively supports the layout.

Examples

```
library(igraph)
g <- sample_gnp(10,0.4)
coords <- layout_with_focus(g,v = 1)
coords</pre>
```

layout_focus_group

radial focus group layout

Description

arrange nodes in concentric circles around a focal node according to their distance from the focus and keep predefined groups in the same angle range.

Usage

```
layout_with_focus_group(
  g,
  ٧,
  group,
  shrink = 10,
 weights = NA,
 iter = 500,
  tol = 1e-04
)
layout_igraph_focus_group(
  g,
  ٧,
  group,
 shrink = 10,
 weights = NA,
  iter = 500,
```

layout_focus_group

```
tol = 1e-04,
circular
)
```

Arguments

g igraph object

v id of focal node to be placed in the center

group vector indicating grouping of nodes

shrink shrink the reserved angle range for a group to increase the gaps between groups

weights possibly a numeric vector with edge weights. If this is NULL and the graph

has a weight edge attribute, then the attribute is used. If this is NA then no weights are used (even if the graph has a weight attribute). By default, weights

are ignored. See details for more.

iter number of iterations during stress optimization

tol stopping criterion for stress optimization

circular not used

Details

Be careful when using weights. In most cases, the inverse of the edge weights should be used to ensure that the endpoints of an edges with higher weights are closer together (weights=1/E(g)\$weight).

Value

matrix of xy coordinates

See Also

layout_focus The layout_igraph_* function should not be used directly. It is only used as an argument for plotting with 'igraph'.

```
library(igraph)
g <- sample_islands(4,5,0.8,2)
grp <- as.character(rep(1:4,each = 5))
layout_with_focus_group(g,v = 1, group = grp, shrink = 10)</pre>
```

layout_manipulate 15

layout_manipulate manipulate layout

Description

functions to manipulate an existing layout

Usage

```
layout_rotate(xy, angle)
layout_mirror(xy, axis = "vertical")
```

Arguments

xy graph layout angle angle for rotation

axis mirror horizontal or vertical

Details

These functions are mostly useful for deterministic layouts such as layout_with_stress

Value

manipulated matrix of xy coordinates

Author(s)

David Schoch

```
library(igraph)
g <- sample_gnp(50,0.3)

xy <- layout_with_stress(g)

#rotate 90 degrees
xy <- layout_rotate(xy,90)

# flip horizontally
xy <- layout_mirror(xy,"horizontal")</pre>
```

16 layout_multilevel

layout_multilevel

multilevel layout

Description

Layout algorithm to visualize multilevel networks

Usage

```
layout_as_multilevel(
  type = "all",
  FUN1,
  FUN2,
 params1 = NULL,
  params2 = NULL,
  ignore_iso = TRUE,
 project2D = TRUE,
 alpha = 35,
 beta = 45
)
layout_igraph_multilevel(
  type = "all",
  FUN1,
  FUN2,
  params1 = NULL,
 params2 = NULL,
  ignore_iso = TRUE,
  alpha = 35,
 beta = 45,
  circular
)
```

Arguments

```
igraph object. Must have a vertex attribute "lvl" which is 1 or 2.
g
                   one of "all", "separate", "fix1" or "fix2". see details
type
FUN1
                   if type="separate", the layout function to be used for level 1
FUN2
                   if type="separate", the layout function to be used for level 2
                   named list of parameters for FUN1
params1
                   named list of parameters for FUN2
params2
                   treatment of isolates within levels. see details
ignore_iso
                   logical. Defaults to TRUE (project to 2D).
project2D
```

layout_pmds 17

alpha angle for isometric projection between 0 and 90 beta angle for isometric projection between 0 and 90

circular not used

Details

The algorithm internally computes a 3D layout where each level is in a separate y-plane. The layout is then projected into 2D via an isometric mapping, controlled by the parameters alpha and beta. It may take some adjusting to alpha and beta to find a good perspective.

If type="all", the layout is computed at once for the complete network. For type="separate", two user specified layout algorithms (FUN1 and FUN2) are used for the levels. The named lists param1 and param2 can be used to set parameters for FUN1 and FUN2. This option helpful for situations where different structural features of the levels should be emphasized.

For type="fix1" and type="fix2" only one of the level layouts is fixed. The other one is calculated by optimizing the inter level ties, such that they are drawn (almost) vertical.

The ignore_iso parameter controls the handling of isolates. If TRUE, nodes without inter level edges are ignored during the layout process and added at the end. If FALSE they are left unchanged

The layout_igraph_* function should not be used directly. It is only used as an argument for plotting with 'igraph'.

Value

matrix of xy coordinates

Examples

layout_pmds

pivot MDS graph layout

Description

similar to layout_with_mds but uses only a small set of pivots for MDS. Considerably faster than MDS and thus applicable for larger graphs.

18 layout_pmds

Usage

```
layout_with_pmds(g, pivots, weights = NA, D = NULL, dim = 2)
layout_igraph_pmds(g, pivots, weights = NA, D = NULL, circular)
```

Arguments

g igraph object pivots number of pivots

weights possibly a numeric vector with edge weights. If this is NULL and the graph

has a weight edge attribute, then the attribute is used. If this is NA then no weights are used (even if the graph has a weight attribute). By default, weights

are ignored. See details for more.

D precomputed distances from pivots to all nodes (if available, default: NULL)

dim dimensionality of layout (defaults to 2)

with 'igraph'. 'ggraph' natively supports the layout.

circular not used

Details

Be careful when using weights. In most cases, the inverse of the edge weights should be used to ensure that the endpoints of an edges with higher weights are closer together (weights=1/E(g)\$weight). The layout_igraph_* function should not be used directly. It is only used as an argument for plotting

Value

matrix of coordinates

## Not run:
library(igraph)
library(ggraph)

g <- sample_gnp(1000,0.01)

xy <- layout_with_pmds(g,pivots = 100)

## End(Not run)</pre>
```

layout_sparse_stress 19

Description

stress majorization for larger graphs based on a set of pivot nodes.

Usage

```
layout_with_sparse_stress(g, pivots, weights = NA, iter = 500)
layout_igraph_sparse_stress(g, pivots, weights = NA, iter = 500, circular)
```

Arguments

g igraph object
pivots number of pivots
weights ignored

iter number of iterations during stress optimization

circular not used

Details

The layout_igraph_* function should not be used directly. It is only used as an argument for plotting with 'igraph'. 'ggraph' natively supports the layout.

Value

matrix of xy coordinates

Author(s)

David Schoch

References

Ortmann, M. and Klimenta, M. and Brandes, U. (2016). A Sparse Stress Model. https://arxiv.org/pdf/1608.08909.pdf

```
## Not run:
library(igraph)
library(ggraph)

g <- sample_gnp(1000,0.005)

```

20 layout_spectral

```
geom_edge_link0(edge_colour = "grey66")+
geom_node_point(shape = 21,fill = "grey25",size = 5)+
theme_graph()
## End(Not run)
```

layout_spectral

spectral graph layouts

Description

Using a set of eigenvectors of matrices associated with a graph as coordinates

Usage

```
layout_with_eigen(g, type = "laplacian", ev = "smallest")
layout_igraph_eigen(g, type = "laplacian", ev = "smallest", circular)
```

Arguments

g igraph object

type matrix to be used for spectral decomposition. either 'adjacency' or 'laplacian'

ev eigenvectors to be used. Either 'smallest' or 'largest'.

circular not used

Details

The layout_igraph_* function should not be used directly. It is only used as an argument for plotting with 'igraph'. 'ggraph' natively supports the layout.

Value

matrix of xy coordinates

Author(s)

David Schoch

```
library(igraph)
g <- sample_gnp(50,0.2)

xy <- layout_with_eigen(g,type = "adjacency",ev = "largest")

xy <- layout_with_eigen(g,type = "adjacency",ev = "smallest")</pre>
```

layout_stress 21

```
xy <- layout_with_eigen(g,type = "laplacian",ev = "largest")
xy <- layout_with_eigen(g,type = "laplacian",ev = "smallest")</pre>
```

layout_stress

stress majorization layout

Description

force-directed graph layout based on stress majorization.

Usage

```
layout_with_stress(
 g,
 weights = NA,
 iter = 500,
  tol = 1e-04,
 mds = TRUE,
 bbox = 30
)
layout_igraph_stress(
 g,
 weights = NA,
 iter = 500,
  tol = 1e-04,
 mds = TRUE,
 bbox = 30,
  circular
```

Arguments

g	igraph object
weights	possibly a numeric vector with edge weights. If this is NULL and the graph has a weight edge attribute, then the attribute is used. If this is NA then no weights are used (even if the graph has a weight attribute). By default, weights are ignored. See details for more.
iter	number of iterations during stress optimization
tol	stopping criterion for stress optimization
mds	should an MDS layout be used as initial layout (default: TRUE)
bbox	width of layout. Only relevant to determine the placement of disconnected graphs
circular	not used

22 layout_stress3D

Details

Be careful when using weights. In most cases, the inverse of the edge weights should be used to ensure that the endpoints of an edges with higher weights are closer together (weights=1/E(g)\$weight).

The layout_igraph_* function should not be used directly. It is only used as an argument for plotting with 'igraph'. 'ggraph' natively supports the layout.

Value

matrix of xy coordinates

```

Examples

```
library(igraph)
library(ggraph)
set.seed(665)

g <- sample_pa(100,1,1,directed = FALSE)

# calculate layout manually
xy <- layout_with_stress(g)

# use it with ggraph
## Not run:
ggraph(g,layout = "stress")+
    geom_edge_link0(edge_width = 0.2,colour = "grey")+
    geom_node_point(col = "black",size = 0.3)+
    theme_graph()

## End(Not run)</pre>
```

layout_stress3D

stress majorization layout in 3D

Description

force-directed graph layout based on stress majorization in 3D.

layout_stress3D 23

Usage

```
layout_with_stress3D(
   g,
   weights = NA,
   iter = 500,
   tol = 1e-04,
   mds = TRUE,
   bbox = 30
)
```

Arguments

g	igraph object
weights	possibly a numeric vector with edge weights. If this is NULL and the graph has a weight edge attribute, then the attribute is used. If this is NA then no weights are used (even if the graph has a weight attribute). By default, weights are ignored. See details for more.
iter	number of iterations during stress optimization
tol	stopping criterion for stress optimization
mds	should an MDS layout be used as initial layout (default: TRUE)
bbox	width of layout. Only relevant to determine the placement of disconnected graphs

Details

Be careful when using weights. In most cases, the inverse of the edge weights should be used to ensure that the endpoints of an edges with higher weights are closer together (weights=1/E(g)\$weight).

Value

matrix of xyz coordinates

24 layout_umap

layout_umap	UMAP graph layouts

Description

Using the UMAP dimensionality reduction algorithm as a graph layout

Usage

```
layout_with_umap(g, pivots = NULL, ...)
layout_igraph_umap(g, circular, ...)
```

Arguments

g igraph object
pivots if not NULL, number of pivot nodes to use for distance calculation (for large graphs).
... additional parameters for umap. See the ?uwot::umap for help.
circular not used

Details

The layout_igraph_* function should not be used directly. It is only used as an argument for plotting with 'igraph'. UMAP can be tuned by many different parameters. Refer to the documentation at https://github.com/jlmelville/uwot for help

Value

matrix of xy coordinates

```
library(igraph)
g <- sample_islands(10,20,0.6,10)
xy <- layout_with_umap(g,min_dist = 0.5)</pre>
```

multilvl_ex 25

 $multilvl_ex$

Multilevel example Network

Description

Multilevel network, where both levels have different structural features

Usage

 $multilvl_ex$

Format

igraph object
