

Package ‘jgsbook’

December 13, 2022

Type Package

Title Package of the German Book ``Statistik mit R und RStudio'' by
Joerg grosse Schlar mann

Description All datasets and functions used in the german book ``Statistik mit R und RStudio'' by grosse Schlar mann (2022) <<https://www.produinis.de/R/>>.

Version 1.0.2

Date 2022-12-11

Language de-de

License GPL (>= 2)

Depends R (>= 3.5.0)

Encoding UTF-8

Imports statip, jsonlite, httr, curl

LazyData true

RoxygenNote 7.2.2

NeedsCompilation no

Author Jörg große Schlar mann [aut, cre]

Maintainer Jörg grote Schlar mann <schlar mann@produinis.de>

epa	<i>Datatable of the epa Example</i>
------------	-------------------------------------

Description

Datatable of the epa Example

Usage

```
data(epa)
```

Format

A data frame with 620 observations in 6 variables

Details

Variables in the dataset:

- sex. a factor with levels m w d, giving the proband's sex
- age. a numeric vector
- cms. a numeric vector
- risk. a dichotome vector, 0 = not at risk, 1 = at risk
- expert. a dichotome vector of expert's decision, 0 = not at risk, 1 = at risk
- decu. a dichotome vector, 0 = no decubitus, 1 = decubitus

Faktorenbogen*Datatable of the Faktorenbogen Example for factor analysis*

Description

Datatable of the Faktorenbogen Example for factor analysis

Usage

```
data(Faktorenbogen)
```

Format

A data frame with 150 observations in 14 variables

Details

Variables in the dataset:

- gender. a factor with levels female male other, giving the proband's gender
- age. a numeric vector of proband's age in years
- A. Item A of the questionnaire, numeric
- B. Item B of the questionnaire, numeric
- C. Item C of the questionnaire, numeric
- D. Item D of the questionnaire, numeric
- E. Item E of the questionnaire, numeric
- F. Item F of the questionnaire, numeric
- G. Item G of the questionnaire, numeric
- H. Item H of the questionnaire, numeric
- I. Item I of the questionnaire, numeric
- J. Item J of the questionnaire, numeric
- K. Item K of the questionnaire, numeric
- L. Item L of the questionnaire, numeric

`freqTable` *create a frequency table*

Description

returns a frequency table with absolute and relative frequencies and cumulated frequencies

Usage

```
freqTable(werte)
```

Arguments

<code>werte</code>	factor with obeserved data
--------------------	----------------------------

Value

dataframe table

Examples

```
x <- ceiling(stats::rnorm(20))
freqTable(x)
```

`kenngroessen` *create a tibble with kenngroessen*

Description

returns a tibble with all kenngroessen

Usage

```
kenngroessen(werte)
```

Arguments

<code>werte</code>	numeric vector
--------------------	----------------

Value

tibble with all kenngroessen

Examples

```
x <- ceiling(stats::rnorm(20))
kenngroessen(x)
```

KIbinomial_a*compute confidence intervall for binomial proportions*

Description

returns borders and length of confidence intervall for binomial proportions

Usage

```
KIbinomial_a(p, n, alpha)
```

Arguments

p	proportion obesored
n	number of observations
alpha	error niveau

Value

confidence intervall

Examples

```
KIbinomial_a(0.35, 150, 0.05)
```

KIbinomial_u*compute confidence intervall for difference of binomial proportions*

Description

returns borders and length of confidence intervall for difference of binomial proportions

Usage

```
KIbinomial_u(p1, n1, p2, n2, alpha)
```

Arguments

p1	proportion obesored in group 1
n1	number of observations in group 1
p2	proportion obeserved in group 2
n2	number of observations in group 2
alpha	error niveau

Value

confidence intervall

Examples

```
KIbinomial_u(0.25, 100, 0.4, 150, 0.05)
```

KInormal_a

compute confidence intervall for mean of normal distributed data

Description

returns borders and length of confidence intervall for mean of normal distributed data

Usage

```
KInormal_a(xquer, s, n, alpha)
```

Arguments

xquer	mean of obesored data
s	standard deviation of observed data
n	number of observations
alpha	error niveau

Value

confidence intervall

Examples

```
KInormal_a(400, 20, 100, 0.05)
```

KInormal_u

*compute confidence intervall for mean of normal distributed data***Description**

returns borders and length of confidence intervall for mean of normal distributed data

Usage

```
KInormal_u(x1, s1, n1, x2, s2, n2, alpha)
```

Arguments

x1	mean of obeserved data in group 1
s1	standard deviation of observed data in group 1
n1	number of observations in group 1
x2	mean of obeserved data in group 2
s2	standard deviation of observed data in group 2
n2	number of observations in group 2
alpha	error niveau

Value

confidence intervall

Examples

```
KInormal_u(2.22, 0.255, 13, 2.7, 0.306, 10 , 0.05)
```

lon.lat.osm

*get longitude and altitude from an address using OpenStreetMap's API at <http://nominatim.openstreetmap.org>***Description**

get longitude and altitude from an address using OpenStreetMap's API at <http://nominatim.openstreetmap.org>

Usage

```
lon.lat.osm(address = NULL)
```

Arguments

address	a character of an address
---------	---------------------------

Value

a data.frame containig "address", "lon", "lat"

Examples

```
lon.lat.osm("Ernst-Kuzorra-Platz, Gelsenkirchen")
```

mma*Dataset of a work sampling study***Description**

Dataset of a work sampling study

Usage

```
data(mma)
```

Format

A data frame with 9768 observations in 6 variables.

Details

Variables in the dataset:

- day. a vector, giving the number of the observation day
- time. a factor giving the time of observation
- ward. a factor giving the ward under observation
- qual. a factor giving the qualification of the nurse
- category. a factor of qualification categories
- action. a factor giving the observed action

Source

<https://www.produnis.de/R/>

Nachtwachen

Dataset of the German Nachtwachen study

Description

Dataset of the German Nachtwachen study

Usage

```
data(Nachtwachen)
```

Format

A data frame with 276 observations in 37 variables.

Source

<https://www.produinis.de/R/>

nw

Dataset of the German Nachtwachen study with labelled variables

Description

Dataset of the German Nachtwachen study, labelled version

Usage

```
data(nw)
```

Format

A data frame with 276 observations in 37 variables.

Source

<https://www.produinis.de/R/>

OrdinalSample*Datatable of an Ordinal Sample***Description**

Datatable of an Ordinal Sample

Usage

```
data(OrdinalSample)
```

Format

A data frame with 415 observations in 4 variables.

Details

Variables in the dataset:

- Konflikt. a numeric vector giving the potential of conflicts.
- Zufriedenh. a numeric vector giving the satisfaction of workers
- Geschlecht. a factor of proband's sex, 1 = male, 2=female
- Stimmung. an ordinal factor of proband's mood

Source

<https://www.produinis.de/R/>

pf8*Dataset of the PF8 example.***Description**

This is the dataset of the PF8 example.

Usage

```
data(pf8)
```

Format

A data frame with 731 observations in 16 variables.

Source

<https://www.produinis.de/R/>

Pflegeberufe

Matrix of Pflegeberufe by Isfort et al. 2018

Description

Matrix of Pflegeberufe by Isfort et al. 2018

Usage

```
data(Pflegeberufe)
```

Format

A matrix with 9 cols (years) and 5 rows (nursing profession).

Author(s)

Isfort et al. 2018 (Pflegethermometer)

Source

<https://www.produnis.de/R/>

sens.spec

compute sensitivity and specificity

Description

returns sensitivity specificity, negativ-predictive-value, postitiv-predictive-value

Usage

```
sens.spec(rp, rn, fp, fn)
```

Arguments

- | | |
|----|---|
| rp | number of true-positive (richtig-positiv) |
| rn | number of true-negative (richtig-negativ) |
| fp | number of false-positive (falsch-positiv) |
| fn | number of false-negative (falsch-negativ) |

Value

a data.frame with sens, spec, ppw, npw

Examples

```
sens.spec(40, 17, 85, 4)
```

ztrans*z-Transformation by given numbers, with $z = (x - \mu) / s_d$*

Description

z-Transformation by given numbers, with $z = (x - \mu) / s_d$

Usage

```
ztrans(x, mu = 0, sd = 1)
```

Arguments

x	a value to transform
mu	the given mu
sd	the given standard deviation

Value

the z-transformed value

Examples

```
ztrans(120, mu=118, sd=20)
```
