# Package 'netCoin'

October 13, 2022

**Type** Package

**Version** 2.0.20

**Date** 2021-10-27

**Title** Interactive Analytic Networks

**Description** Create interactive analytic networks. It joins the data analysis power of R to obtain coincidences, co-occurrences and correlations, and the visualization libraries of 'JavaScript' in one package.

**License** GPL-2 | GPL-3

**Depends** R (>= 3.5.0)

**Imports** rD3plot (>= 1.0.0), igraph (>= 1.0.1), Matrix (>= 1.2-4), haven (>= 1.1.0)

**Suggests** knitr, rmarkdown, lavaan, shiny, htmltools

**VignetteBuilder** knitr

**NeedsCompilation** no

**Maintainer** Modesto Escobar <modesto@usal.es>

**URL** https://modesto-escobar.github.io/netCoin-2.x/

**Encoding** UTF-8

**BugReports** https://github.com/Modesto-Escobar/netCoin-2.x/issues

**Author** Modesto Escobar [cre, aut, cph]
   (<https://orcid.org/0000-0003-2072-6071>),
   David Barrios [aut],
   Carlos Prieto [aut],
   Luis Martinez-Uribe [aut] (<https://orcid.org/0000-0002-7795-3972>),
   Pablo Cabrera-Álvarez [aut]

**Repository** CRAN

**Date/Publication** 2021-10-28 17:20:05 UTC

# R **topics documented:**

| netCoin-package | *The netCoin package.* |
| --- | --- |

### Description

Create interactive networked coincidences. It joins the data analysis power of R to study coincidences and the visualization libraries of JavaScript in one package.

### Details

Coincidence analysis detects what events, characters, objects, attributes, or characteristics tend to occur together within certain limits.

These given limits are call scenarios ($S$) and are considered to be the units of analysis, and as such they have to be placed in the rows of a matrix or data.frame.

In each $i$ scenario, a series of $J$ events $X_j$, which are to be represented as dichotomous variables $X_j$ in columns, may occur (1) or may not occur (0). Scenarios and events constitute an incidence matrix ($\mathbf{I}$).

**Incidence matrix**

|       | $X_1$ | $X_2$ | $X_3$ | $\ldots$ | $X_J$ |
| ----- | ----- | ----- | ----- | -------- | ----- |
| $S_1$ | 0     | 1     | 0     | $\ldots$ | 1     |
| $S_2$ | 1     | 0     | 1     | $\ldots$ | 0     |
| $\ldots$ | $\ldots$ | $\ldots$ | $\ldots$ | $\ldots$ | $\ldots$ |
| $S_n$ | 1     | 1     | 0     | $\ldots$ | 1     |

From this incidences matrix, a coincidence ($\mathbf{C}$) matrix can be obtained with the function `coin`. In this matrix the main diagonal represents frequencies of $X_j$, while the others elements are number of coincidences between two events.

**Coincidence matrix**

|       | $X_1$ | $X_2$ | $X_3$ |          | $X_J$ |
| ----- | ----- | ----- | ----- | -------- | ----- |
| $X_1$ | 2     | 1     | 1     | $\ldots$ | 1     |
| $X_2$ | 1     | 2     | 0     | $\ldots$ | 2     |
| $X_3$ | 1     | 0     | 1     | $\ldots$ | 0     |
| $\ldots$ | $\ldots$ | $\ldots$ | $\ldots$ | $\ldots$ | $\ldots$ |
| $X_J$ | 1     | 2     | 0     | $\ldots$ | 2     |

Once there is a `coin` object, a similarity matrix can be obtained. Similarity matrices available in netCoin are:

- Matching (m), Rogers \& Tanimoto (t) Gower (g) Sneath (s) and Anderberg (and).
- Jaccard (j), dice (d), antiDice (a), Ochiai (o) and Kulczynski (k).
- Hamann (ham), Yule (y), Pearson (p), odds ratio (od) and Rusell (r).

Other measures that can be obtained from coin are:

- Relative frequencies (x), conditional frequencies (i) coincidence degree (cc) and probable degree of coincidence (cp).
- Haberman (h) and Z value of Haberman (z)

To obtain similarity and other measures matrices, the function sim elaborates a list of them.

**Similarity matrix**

|       | $X_1$ | $X_2$ | $X_3$ |     | $X_J$ |
|-------|-------|-------|-------|-----|-------|
| $X_1$ | 1.73  | -.87  | .87   | ... | -.87  |
| $X_2$ | -.87  | 1.73  | -1.73 | ... | 1.73  |
| $X_3$ | .87   | -1.73 | 1.73  | ... | -1.73 |
| ...   | ...   | ...   | ...   | ... | ...   |
| $X_J$ | -.87  | 1.73  | -1.73 | ... | 1.73  |

edgeList makes a collecion of edges composed by a list of similarity measures whenever a criterium (generally p(Z)<.50) is met.

**Edge list**

|   | source | target | Haberman  | P(z)       |
|---|--------|--------|-----------|------------|
| 1 | X1     | X3     | 0.8660254 | 0.22509243 |
| 2 | X2     | X4     | 1.7320508 | 0.09084506 |

In order to make a graph, two data frames are needed: a nodes data frames with names and other nodes attributes (see asNodes) and an edge data frame (see edgeList). For more information go to netCoin.

---

| allNet | *Networked coincidences from incidences data.* |
|---|---|

---

### Description

`allNet` produces a network object of coincidences from a data frame or a matrix with dichotomous values.

### Usage

```
allNet(incidences, weight = NULL, subsample = FALSE, pairwise = FALSE,
       minimum=1, maximum = nrow(incidences),
       sort = FALSE, decreasing = TRUE,
       frequency = FALSE, percentages = TRUE,
       procedures = "Haberman", criteria = "Z", Bonferroni = FALSE,
       support = -Inf, minL = -Inf, maxL = Inf,
       directed = FALSE, diagonal = FALSE,
       sortL = NULL, decreasingL = TRUE,
       igraph = FALSE, dir=NULL, ...)
```

### Arguments

| | |
|---|---|
| incidences | an incidence matrix or data frame with only 0/1 variables. |
| weight | a vector of weights. Optimal for data.framed tables. |
| subsample | retrict the analysis to scenarios with at least one event. |
| pairwise | Pairwise mode of handling missing values if TRUE. Listwise by default. |
| minimum | minimum frequency to be considered. |
| maximum | maximum frequency to be considered. |
| sort | sort the coincidence matrix according to frequency of events. |
| decreasing | decreasing or increasing sort of the matrix. |
| frequency | a logical value true if frequencies are to be shown. Default = FALSE. |
| percentages | a logical value true if percentages are to be shown. Default = TRUE. |
| procedures | a vector of statistics of similarity. See below. |
| criteria | statistic to be use for selection criteria. |
| Bonferroni | Bonferroni criterium of the signification test. |
| support | minimum value of the frequency of the coincidence to be edged. |
| minL | minimum value of the statistic to include the edge in the list. |
| maxL | maximum value of the statistic to include the edge in the list. |
| directed | includes same edges only once. |
| diagonal | includes auto-links. |
| sortL | sort the list according to the values of a statistic. See below. |

| | |
|---|---|
| decreasingL | order in a decreasing way. |
| igraph | Produces an igraph object instead of a netCoin object if TRUE. |
| dir | a "character" string representing the directory where the web files will be saved. |
| ... | Any netCoin argument. |

## Details

Possible measures in procedures are

- Frequencies (f), Relative frequencies (x), Conditional frequencies (i), Coincidence degree (cc), Probable degree (cp),
- Expected (e), Confidence interval (con)
- Matching (m), Rogers & Tanimoto (t), Gower (g), Sneath (s), Anderberg (and),
- Jaccard (j), Dice (d), antiDice (a), Ochiai (o), Kulczynski (k),
- Hamann (ham), Yule (y), Pearson (p), odds ratio (od), Rusell (r),
- Haberman (h), Z value of Haberman (z),
- Hypergeometric p greater value (hyp).
- Convert a matrix into an edge list (shape).

## Value

This function creates a netCoin object (or igraph) and, if stated, a folder in the computer with an HTML document named index.html which contains the produced graph. This file can be directly opened with your browser and sent to a web server to work properly.

## Author(s)

Modesto Escobar, Department of Sociology and Communication, University of Salamanca. See https://sociocav.usal.es/blog/modesto-escobar/

## References

Escobar, M. and Martinez-Uribe, L. (2020) Network Coincidence Analysis: The netCoin R Package. *Journal of Statistical Software*, **93**, 1-32. doi: 10.18637/jss.v093.i11.

## Examples

```
# A character column (with separator)
frame <- data.frame(A = c("Man; Women", "Women; Women",
                    "Man; Man", "Undet.; Women; Man"))
data <- dichotomize(frame, "A", sep = "; ")[2:4]
allNet(data) # network object
```

---

asGallery                           *Images in a grid gallery.*

---

### Description

asGallery produces a gallery_rd3 object.

### Usage

```
asGallery(net)
```

### Arguments

net                  is a network_rd3 object. See [network_rd3](#)

### Value

Object of class gallery_rd3.

### Author(s)

Modesto Escobar, Department of Sociology and Communication, University of Salamanca. See
[https://sociocav.usal.es/blog/modesto-escobar/](https://sociocav.usal.es/blog/modesto-escobar/)

### Examples

```
data("Galapagos")
data("finches")
finches$species <- system.file("extdata", finches$species,
        package="netCoin") # copy path to the species field
Net <- allNet(Galapagos, nodes=finches, criteria="hyp", maxL=.05,
        image="species",
        main="Species coincidences in Galapagos Islands",
        note="Data source: Sanderson (2000)")
gallery <- asGallery(Net)
```

---

asNodes                           *Nodes data frame.*

---

### Description

Nodes data frame from either an edge list or a coin object.

### Usage

```
asNodes(C, frequency = TRUE, percentages = FALSE, language = c("en","es","ca"))
```

## Arguments

| | |
|---|---|
| `C` | has to be an edge list or, better, a `coin` object. |
| `frequency` | add frequency of nodes |
| `percentages` | add nodes percentages |
| `language` | a character vector (es=spanish; en=english; ca=catalan). |

## Value

A data frame with nodes' names and their frequency and/or percentages if the input is a `coin` object

## Author(s)

Modesto Escobar, Department of Sociology and Communication, University of Salamanca. See
https://sociocav.usal.es/blog/modesto-escobar/

## References

Escobar, M. and Martinez-Uribe, L. (2020) Network Coincidence Analysis: The `netCoin` R Package. *Journal of Statistical Software*, **93**, 1-32. doi: 10.18637/jss.v093.i11.

## Examples

```
# From a random incidence matrix I(25X4)
I <- matrix(rbinom(100, 1, .5), nrow = 25, ncol = 4,
      dimnames = list(NULL, c("A", "B", "C", "D")))
C <- coin(I)
asNodes(C)
```

---

barCoin                          *Networked coincidences.*

---

## Description

`barCoin` produces a barCoin object.

## Usage

```
barCoin(data, variables = colnames(data), commonlabel = NULL,
        dichotomies = c("_all","_none"), valueDicho = 1, weight = NULL,
        subsample = FALSE, sort = NULL, decreasing = TRUE, nodes = NULL,
        name = NULL, select = NULL, scalebar = FALSE, note = NULL,
        label = NULL, text = NULL, color = NULL, defaultColor = "#1f77b4",
        expected = FALSE, confidence = FALSE, level = .95, significance = FALSE,
        minimum = 1 , maximum = nrow(data), percentages = FALSE,
        criteria = c("Z","hyp"), Bonferroni = FALSE,
        support = 1, minL = -Inf, maxL = 1,
        language = c("en","es","ca"), cex = 1.0, dir = NULL)
```

## Arguments

| | |
|---|---|
| `data` | a data frame |
| `variables` | a vector of variables included in the previous data frame |
| `commonlabel` | a vector of variables whose names are to be included in nodes labels |
| `dichotomies` | a vector of dichotomous variables to appear as just one categorie |
| `valueDicho` | value to be selected for dichotomous variables. Default is 1 |
| `weight` | a vector of weights. Optimal for data.framed tables. |
| `subsample` | retrict the analysis to scenarios with at least one event. |
| `sort` | name of the vector in the nodes data frame to order the graph. |
| `decreasing` | decreasing or increasing sort of the graph order. |
| `nodes` | a data frame with at least two vectors of names and incidences. |
| `name` | name of the vector with names in the nodes data frame. |
| `select` | Name of the event (in nodes name column) to start the visualization. |
| `scalebar` | Should the bars fill the screen height? Default = FALSE. |
| `note` | lower title of the graph. |
| `label` | name of the vector with labels in the nodes data frame. |
| `text` | name of the vector with html text in the nodes data frame. |
| `color` | name of the vector with color variable in the nodes data frame. |
| `defaultColor` | a character vector giving a valid html color. |
| `expected` | name of the vector with expected coincidences in the links data frame. |
| `confidence` | name of the vector with confidence interval in the links data frame. |
| `level` | confidence level |
| `significance` | name of the vector with significance in the links data frame. |
| `minimum` | minimum frequency to be considered. |
| `maximum` | maximum frequency to be considered. |
| `percentages` | a logical value true if percentages are to be shown. Default = TRUE. |
| `criteria` | statistic to be use for selection criteria. |
| `Bonferroni` | Bonferroni criterium of the signification test. |
| `support` | minimum value of the frequency of the coincidence to be edged. |
| `minL` | minimum value of the statistic to include the edge in the list. |
| `maxL` | maximum value of the statistic to include the edge in the list. |
| `language` | a character vector (es=spanish; en=english; ca=catalan). |
| `cex` | number indicating the amount by which plotting text should be scaled relative to the default. Default = 1. |
| `dir` | a "character" string representing the directory where the web files will be saved. |

## Value

Object of class `barCoin`.

**Author(s)**

Modesto Escobar, Department of Sociology and Communication, University of Salamanca. See
https://sociocav.usal.es/blog/modesto-escobar/

**Examples**

```
# A character column (with separator)
frame <- data.frame(A = c("Man; Women", "Women; Women",
                          "Man; Man", "Undet.; Women; Man"))
data <- dichotomize(frame, "A", sep = "; ")[2:4]

barCoin(data,dichotomies="_all")
barCoin(data,dichotomies="_all",confidence=TRUE,percentages=TRUE)
```

---

calCentr                        *Categorize a network*

---

**Description**

This function calculates the centrality measures of a network.

**Usage**

```
calCentr(graph,
  measures = c("degree","wdegree","closeness","betweenness","eigen"),
  order = "")
```

**Arguments**

| | |
|---|---|
| graph | A netCoin object. |
| measures | Character vector of the measures to be calculated (See details). |
| order | Sort the data.frame by the different measures. |

**Details**

This function reproduces some of the most significant classic Social Network Theory's centrality
measures. See Wasserman (1994), Freeman (1978), or Bonacich & Lloyd (2001) to know more.

a) Degree = Degree centrality is measured by the total amount of direct links with the other nodes.

b) Closeness = Closeness centrality is meant to measure one node to the others nodes' sum distances

c) Betweenness = Betweenness centrality measures one node undertaking "mediation" role in a
network.

d) Eigen = Eigenvector centrality measures a node's importance while giving consideration to the
importance of its neighbors.

By default, measures = "all", thus all the measures will be calculated. The function can be applied to
an igraph or a netCoin object. In case the graph is undirected, it will show the degree, weighted de-
gree, closeness, betweeness and eigen degree. Moreover, if it us directed, it will show the indegree,
windegree and outdegree, both weighted and unweighted (See example.).

## Value

This function creates a list containing two elements: 1) a data.frame (nodes) with all the centrality measures applied to the graph and 2) another data.frame (graph) with this measures applied to the whole network.

## Author(s)

Modesto Escobar, Department of Sociology and Communication, University of Salamanca. See https://sociocav.usal.es/blog/modesto-escobar/

## Examples

```
# A character column (with separator)
frame <- data.frame(A = c("Man; Women", "Women; Women",
                          "Man; Man", "Undet.; Women; Man"))
data <- dichotomize(frame, "A", sep = "; ")[2:4]
C <- coin(data) # coincidence matrix
N <- asNodes(C) # node data frame
E <- edgeList(C) # edge data frame
G <- netCoin(N, E, showArrows=TRUE) # netCoin object
calCentr(G, "all")
```

---

| coexist | coexist *Interactive network of time coexistences of periods.* |

---

## Description

coexist produces interactive graphs representing coexistence. Two periods or lifes coexist if they share a given number of years.

## Usage

```
coexist(periods, name="name", start="start", end="end",
        fields=names(periods), plusstart=0, minusend=0, igraph=FALSE, ...)
```

## Arguments

| | |
|---|---|
| periods | a data frame with at least three vectors with name, start and end of the periods. |
| name | name of the vector with names in the periods data frame. |
| start | name of the vector with starts in the periods data frame. |
| end | name of the vector with ends in the periods data frame. |
| fields | vector of the names of the periods data frame to be taken into account. |
| plusstart | number of years to be trimmed at the beginning of each period. |
| minusend | number of years to be trimmed at the end of each period. |
| igraph | produces an igraph object instead of a netCoin class. |
| ... | Any netCoin argument. |

**Details**

Two periods coexists if they have at least one year in common. Periods can be trimmed at the begining or at the end.

**Value**

This function creates a netCoin object (or igraph) and, if plotted, a folder in the computer with an HTML document named index.html which contains the produced graph. This file can be directly opened with your browser and sent to a web server to work properly.

A netCoin object has three elements:

nodes            A data frame with the periods.

links            A data frame with the events.

options          A list of options for the interactive graph.

**Note**

Periods could be the life of people, in whose case start is their birth and end their death year.

**Author(s)**

Modesto Escobar, Department of Sociology and Communication, University of Salamanca. See https://sociocav.usal.es/blog/modesto-escobar/

**See Also**

timeCoin and dyncohort

**Examples**

```
# With sociologists data.
data(sociologists)
# Produce an igraph object:
coexist(sociologists, start="birth", end="death", igraph=TRUE)
# Omit as coexistence the 15 firts years of life:
sociologists$picture <- system.file("extdata", sociologists$picture,
        package="netCoin") # copy path to the picture field
coexist(sociologists, start="birth", end="death", plusstart=15, image="picture", imageName="name")
```

---

coin                          *Coincidence matrix.*

---

**Description**

A coincidence object consists of a list with two elements: 1) the number of scenarios ($n$), and 2) a coincidence matrix of events, whose main diagonal figures are the frequency of events and outside this diagonal there are conjoint frequencies of these events ($f$)

## Usage

```
coin(incidences, minimum = 1, maximum = nrow(incidences),
     sort = FALSE, decreasing = TRUE,
     total = FALSE, subsample = FALSE,
     weight = NULL, pairwise = FALSE)
```

## Arguments

| | |
|---|---|
| incidences | an incidence matrix or data frame with only 0/1 variables |
| minimum | minimum frequency to be considered |
| maximum | maximum frequency to be considered |
| sort | sort the coincidence matrix according to frequency of events |
| decreasing | decreasing or increasing sort of the matrix |
| total | add one first row and column with total |
| subsample | retrict the analysis to scenarios with at least one event |
| weight | a vector of weights. Optimal for data.framed tables |
| pairwise | Pairwise mode of handling missing values if TRUE. Listwise by default. |

## Details

Produce a matrix of coincidences from a matrix of incidences.

## Value

An object of `coin` class

| | |
|---|---|
| n | Number of scenarios (rows of the incidence matrix) |
| f | Coincidence matrix |

## Author(s)

Modesto Escobar, Department of Sociology and Communication, University of Salamanca. See https://sociocav.usal.es/blog/modesto-escobar/

## References

Escobar, M. and Martinez-Uribe, L. (2020) Network Coincidence Analysis: The `netCoin` R Package. *Journal of Statistical Software*, **93**, 1-32. doi: 10.18637/jss.v093.i11.

## Examples

```
## Random incidence matrix: 25 scenarios, 4 events.
I <- matrix(rbinom(100, 1, .5), nrow = 25, ncol = 4,
            dimnames = list(NULL, c("A", "B", "C", "D")))
coin(I, sort = TRUE)

## Hair by Eye by Sex table from M. Friendly (2000)
```

```
data(HairEyeColor)
H<-as.data.frame(HairEyeColor)
W<-H$Freq
I<-dichotomize(H,c("Hair","Eye","Sex"),add=FALSE)
coin(I,w=W)
```

---

coocur                          *Coocurrence matrix.*

---

### Description

A coocurrence object consists of a matrix with the number of ocurrences in its main diagonal and
the number of coocurrences outside this diagonal. Besides, this object has two attributes: 1) n is
the total of the sum of the ocurrences in each row.2) m is the sum of the maximum number of
ocurrences in each row.

### Usage

```
coocur(ocurrences, minimum = 1, maximum = Inf,
       sort = FALSE, decreasing = TRUE)
```

### Arguments

| | |
|---|---|
| ocurrences | an ocurrence matrix or data frame |
| minimum | minimum frequency to be considered |
| maximum | maximum frequency to be considered |
| sort | sort the coincidence matrix according to frequency of events |
| decreasing | decreasing or increasing sort of the matrix |

### Details

Produce a matrix of coocurrences from a matrix of occurences.

### Value

An object of cooc class with a coocurrence matrix. It has two attributes:

| | |
|---|---|
| n | Total sum of occurences) |
| m | Sum of maximum occurences in each row of the ocurrence matrix |

### Author(s)

Modesto Escobar, Department of Sociology and Communication, University of Salamanca. See
https://sociocav.usal.es/blog/modesto-escobar/

### Examples

```
## Tossing two coins five times.
D<-data.frame(Head=c(2,1,1,0,2),Tail=c(0,1,1,2,0))
coocur(D)
```

---

dice                           *Data: Roll a die (100 times).*

---

### Description

Data frame with events as result.

### Usage

```
data("dice")
```

### Format

A data frame with 100 observations (scenarios) on the following 11 variables (events):

dice : a numeric vector, representing dice results

1 : a dichotomous vector of the elemental event "1"

2 : a dichotomous vector of the elemental event "2"

3 : a dichotomous vector of the elemental event "3"

4 : a dichotomous vector of the elemental event "4"

5 : a dichotomous vector of the elemental event "5"

6 : a dichotomous vector of the elemental event "6"

odd : a dichotomous vector of odd events

even : a dichotomous vector of even events

small : a dichotomous vector of small number events

large : a dichotomous vector of large number events

### Source

Random extraction via sample(1:6,100,replace=TRUE)

### References

See events.

### Examples

```
data(dice)
head(dice,10)
```

---

`dichotomize` *Dichotomize.*

---

### Description

This converts factor(s) o character(s) column(s) of a data frame into a set of dichotomous columns. Their names will correspond to the labels or text of every category.

### Usage

```
dichotomize(data, variables,
            sep = "", min = 1, length = 0, values = NULL,
            sparse = FALSE, add = TRUE, sort = TRUE, nas = "None")
```

### Arguments

| | |
|---|---|
| `data` | a data frame with a factor or textual column which can be simple (only one value for each scenario) or multiple if components are delinited with a separator. |
| `variables` | vector of column names that have to be converted into dichotomous vectors. |
| `sep` | vector of characters used to divide columns with multiple events. If this separator is "", every unique cell of every column is converted into a dichotomus data frame's column. |
| `min` | convert to dichotomous vectors only label or text that has a frequency less or equal to the value of this parameter. If the value of min is between 0 and 1, its value is interpreted as a percentage |
| `length` | maximum number of dichotomous columns generated for every variable |
| `values` | vector of labels or texts selected to their conversion to dichotomous columns |
| `sparse` | produce a sparse matrix instead of a data.frame |
| `add` | add the new columns to the input data.frame |
| `sort` | order the new columns by their frequencies |
| `nas` | variable name to convert the NA values of the set of variables |

### Value

A data frame composed by the original plus the added dichotmous columns.

### Author(s)

Modesto Escobar, Department of Sociology and Communication, University of Salamanca, and Luis Martinez Uribe, Fundacion Juan March. See https://sociocav.usal.es/blog/modesto-escobar/

### References

Escobar, M. and Martinez-Uribe, L. (2020) Network Coincidence Analysis: The netCoin R Package. *Journal of Statistical Software*, **93**, 1-32. doi: 10.18637/jss.v093.i11.

## Examples

```
# A character column
frame1 <- data.frame(A = c("Man", "Women", "Man", "Undet."))
dichotomize(frame1, "A", sep = "; ")

# A character column (with separator)
frame2 <- data.frame(A = c("Man; Women", "Women; Women",
                           "Man; Man", "Undet.; Women; Man"))
dichotomize(frame2, "A", sep = "; ")

# A character column and another factor column (same sepatator)
frame3 <- data.frame(A = c("Man; Women", "Women; Women",
                           "Man; Man", "Undet.; Women; Man"),
                     C = factor(c(1:4), labels = c("Paris", "New York",
                           "London; New York", "<NA>")))
dichotomize(frame3, c("A", "C"), sep = "; ")

# A set of simple character or factor (same levels) variables.
# In this case, you must use "C" separator.
frame4 <- data.frame(A = c("Man", "Women","Man", "Undet",NA),
                     B = c("Women","Women","Man","Women",NA),
 C = c(NA,NA,NA,"Man",NA))
dichotomize(frame4,c("A","B","C"), sep="C")
```

---

| distant | *Distance matrix.* |
|---------|--------------------|

---

## Description

Convert a similarity matrix into a distance matrix.

## Usage

```
distant(s, t = FALSE)
```

## Arguments

| s | a similarity matrix |
|---|---------------------|
| t | return the same matrix if t=FALSE |

## Details

For better resultas, use the parameter distance in [sim](#) function.

## Value

A distance matrix.

**Author(s)**

Modesto Escobar, Department of Sociology and Communication, University of Salamanca. See https://sociocav.usal.es/blog/modesto-escobar/

**Examples**

```
# From a random incidence matrix I(25X4)
I <- matrix(rbinom(100, 1, .5), nrow = 25, ncol = 4,
     dimnames = list(NULL, c("A", "B", "C", "D")))
J <- sim(I, "Jaccard")
distant(J, t = TRUE)
#Same results
sim(I, "Jaccard", distance = TRUE)
```

---

dyncohort                    *Interactive graphs of dynamic cohorts.*

---

**Description**

dyncohort produces interactive graphs representing dynamic cohorts. Two periods or lifes belongs to the same cohort if there are a difference of years in their start less or equal to a given number. In case of people's life, 15 or 25 are appropiate quantities to set. If year is equal to 0, a cohort is defined a those periods or lifes that begin at the same year.

**Usage**

```
dyncohort(periods, name="name", start="start", fields=names(periods),
          years=0, igraph=FALSE, ...)
```

**Arguments**

| | |
|---|---|
| periods | a data frame with at least two vectors with name and start of the periods or lives. |
| name | name of the vector with names in the data frame. |
| start | name of the vector with starts in the data frame. |
| fields | vector of the names of the periods data frame to be taken into account. |
| years | number of years to be considered as length of the cohort. |
| igraph | produces an igraph object instead of a netCoin class. |
| ... | Any netCoin argument. |

**Value**

This function creates a timeCoin object (or igraph) and, if plotted, a folder in the computer with an HTML document named index.html which contains the produced graph. This file can be directly opened with your browser and sent to a web server to work properly.

A netCoin object has three elements:

| nodes | A data frame with the periods. |
| links | A data frame with the events. |
| options | A list of options for the interactive graph. |

## Note

Periods could be the life of people, in whose case start is their birth year.

## Author(s)

Modesto Escobar, Department of Sociology and Communication, University of Salamanca. See
https://sociocav.usal.es/blog/modesto-escobar/

## See Also

timeCoin and coexist

## Examples

```
# With sociologists data.
data(sociologists)
dyncohort(sociologists, start="birth")
# Condider 15 year dynamic cohort:
sociologists$picture <- system.file("extdata", sociologists$picture,
        package="netCoin") # copy path to the picture field
dyncohort(sociologists, start="birth", year=15, image="picture", imageName="name")
```

---

edgeList                           *Edge list.*

---

## Description

Convert a coincidence/similarity/distance matrix into an edge list form.

## Usage

```
edgeList(data, procedures="Haberman",
         criteria="Z", level=.95, Bonferroni=FALSE,
         min=-Inf, max=Inf, support=-Inf, directed=FALSE,
         diagonal=FALSE, sort=NULL, decreasing=TRUE, pairwise=FALSE)
```

## Arguments

| data | a coin object, let's say an R matrix with frequencies and an attribute (n) giving the number of scenarios. In case of change of shape, data should be a matrix. |
| procedures | a vector of statistics of similarity. See below. |
| criteria | statistic to be use for selection criteria. |

| level | confidence level |
|---|---|
| Bonferroni | Bonferroni criterium of the signification test. |
| min | minimum value of the statistic to include the edge in the list. |
| max | maximum value of the statistic to include the edge in the list. |
| support | minimum value of the frequency of the coincidence to be edged |
| directed | includes same edges only once. |
| diagonal | includes auto-links |
| sort | sort the list according to the values of a statistic. See below |
| decreasing | order in a decreasing way. |
| pairwise | Pairwise mode of handling missing values if TRUE. Listwise by default. |

## Details

Possible measures in procedures are

- Frequencies (f), Relative frequencies (x), Conditional frequencies (i), Coincidence degree (cc), Probable degree (cp),
- Expected (e), Confidence interval (con)
- Matching (m), Rogers & Tanimoto (t), Gower (g), Sneath (s), Anderberg (and),
- Jaccard (j), Dice (d), antiDice (a), Ochiai (o), Kulczynski (k),
- Hamann (ham), Yule (y), Pearson (p), odds ratio (od), Rusell (r),
- Haberman (h), Z value of Haberman (z),
- Hypergeometric p greater value (hyp).
- Convert a matrix into an edge list (shape).

## Value

A data frame in which the two first columns are source and target. The rest of the columns are the different statistics explicited in `funcs` parameter.

## Author(s)

Modesto Escobar, Department of Sociology and Communication, University of Salamanca. See https://sociocav.usal.es/blog/modesto-escobar/

## References

## Examples

```
# From a random incidence matrix I(25X4)
I<-matrix(rbinom(100,1,.5),nrow=25,ncol=4,
dimnames=list(NULL,c("A","B","C","D")))
C<-coin(I)
edgeList(C)
```

---

ess *Data: European Social Survey, Round-8.*

---

### Description

A sample size of 1,000 respondents from the European Social Survey, Round-8.

### Usage

```
data("ess")
```

### Format

A data frame with 1000 cases (respondents) and 5 variables:

Gender Gender (factor vector): Female, Male.

Age Age (recoded factor vector): 15-29, 30-30, 40-49, 50-59, 60-69, 70 and +.

Social participation Social participation (factor vector): No, Yes.

Political participation Political participation (factor vector): No, Yes.

cweight cweight (numeric vector): Cases weight.

### References

ESS Round 8: European Social Survey Round 8 Data (2016). Data file edition 2.1. NSD - Norwegian Centre for Research Data, Norway - Data Archive and distributor of ESS data for ESS ERIC. doi:10.21338/NSD-ESS8-2016.

### Examples

```
data("ess")
head(ess,10)
```

---

events *Data: Attributes of the dice events.*

---

### Description

Data frame with the attributes of the events of dice.

### Usage

```
data("events")
```

## Format

A data frame with 10 observations on the following 4 variables:

name : a factor vector with 10 levels

label : a factor vector with 10 levels

frequency : a numeric vector

type : a factor vector with 2 levels

## Source

data(dice); coin.dice<-coin(dice); asNodes(coin.dice)

## References

See [dice](#).

## Examples

```
data(events)
events
```

---

| expectedList | *Expected list.* |
|---|---|

---

## Description

Converts a `coin` object to a links data frame with coincidences and expected values.

## Usage

```
expectedList(data, names = NULL, min = 1, confidence=FALSE)
```

## Arguments

| | |
|---|---|
| data | is a coin object. See [coin](#) |
| names | a character vector. |
| min | minimum value of the statistic to include the edge in the list. |
| confidence | add the confidence interval if TRUE. |

## Value

A links data frame with coincidences and expected values.

## Author(s)

Modesto Escobar, Department of Sociology and Communication, University of Salamanca. See
[https://sociocav.usal.es/blog/modesto-escobar/](https://sociocav.usal.es/blog/modesto-escobar/)

## Examples

```
# A character column (with separator)
frame <- data.frame(A = c("Man; Women", "Women; Women",
                          "Man; Man", "Undet.; Women; Man"))
data <- dichotomize(frame, "A", sep = "; ")[2:4]
C <- coin(data) # coincidence matrix
expectedList(C) # edge data frame
```

---

| families | *Data: Italian families in the Renaissance.* |
|---|---|

---

## Description

Data frame with the characteristics of powerful families of Renaissance Italy.

## Usage

```
data("families")
```

## Format

A data frame with 16 families (rows) and 6 characteristics.

name  Family's name

f.Marriages  number of marriage links

f.Business  number of business links

wealth  wealth's index

priorates  number of priorates on control

seat  At least priorate

## Source

PADGETT, J. F. Y C. K. ANSELL (1993): "Robust Action and the Rise of the Medici, 1400-1434", in American Journal of Sociology, 98, 1259-1319. (http://www.jstor.org/stable/2781822)

## Examples

```
data("families")
head(families)
```

---

finches                         *Data: Finches'attributes in Galapagos islands.*

---

### Description

Data frame with events as result.

### Usage

```
data("finches")
```

### Format

A data frame with 13 observations (pinches) and 4 variables (name and characteristics):

name : Genus and species of the finche

frequency : number of islands where the finche can be found

type : Genus of the finche

species : name of the file containing the picture of the finche

### Examples

```
data(finches)
head(finches,10)
```

---

fromIgraph                      *Produce interactive networks from igraph objects.*

---

### Description

fromIgraph produce an interactive network from an igraph object.

### Usage

```
fromIgraph(G, ...)
```

### Arguments

G              an igraph object.

...            Any network_rd3 argument.

## Value

This function returns a `network_rd3` object. If the 'dir' attribute is specified, the function creates a folder in the computer with an HTML document named index.html which contains the produced graph. This file can be directly opened with your browser and sent to a web server to work properly.

## Author(s)

Modesto Escobar, Department of Sociology and Communication, University of Salamanca. See https://sociocav.usal.es/blog/modesto-escobar/

```
g <- igraph::make_ring(10)
fromIgraph(g)
```

---

Galapagos                        *Data: Finches' presence in Galapagos Islands.*

---

## Description

Data frame with absence(0) presence(1) of finches in the Galagos Islands.

## Usage

```
data("Galapagos")
```

## Format

A data frame with 17 localizations (islands) and 13 variables (Genus and species of the finches):

```
Geospiza magnirostris
Geospiza fortis
Geospiza fuliginosa
Geospiza difficilis
Geospiza scandens
Geospiza conirostris
Camarhynchus psitticula
Camarhynchus pauper
Camarhynchus parvulus
Platyspiza crassirostris
```

```
Cactospiza pallida

Cactospiza heliobates

Certhidea olivacea
```

### References

Sanderson, James (2000). Testing Ecological Patterns: A Well-known Algorithm from Computer Science Aids the Evaluation of Species Distributions. American Scientist, 88, pp. 332-339.

### Examples

```
data(Galapagos)
head(Galapagos,10)
```

---

gallery                              *Images in a grid gallery.*

---

### Description

gallery produces a gallery_rd3 object.

### Usage

```
gallery(nodes, name = NULL, label = NULL, color = NULL,
    ntext = NULL, info = NULL, image = NULL, zoom = 1,
    itemsPerRow = NULL, main = NULL, note = NULL,
    showLegend = TRUE, frequencies = FALSE,
    help = NULL, helpOn = FALSE, description = NULL,
    descriptionWidth = NULL, roundedItems = FALSE, controls = 1:2,
    cex = 1, language = c("en", "es", "ca"), dir = NULL)
```

### Arguments

| | |
|---|---|
| nodes | a data frame with at least three columns of names, start and end. |
| name | column name with image names in the nodes data frame. |
| label | column name with image labels in the nodes data frame. |
| color | column name with image background color variable in the nodes data frame. |
| ntext | column name with html text in the nodes data frame. |
| info | column name with information to display in a panel in the nodes data frame. |
| image | column name which indicates the image paths in the nodes data frame. |
| zoom | a number between 0.1 and 10 as initial displaying zoom. |
| itemsPerRow | number of items in each row. |
| main | upper title of the graph. |
| note | lower title of the graph. |

| frequencies | a logical value true if barplots representing node attributes frequencies will be added to the final graph. |
| --- | --- |
| showLegend | a logical value true if the legend is to be shown. |
| help | a character string indicating a help text of the graph. |
| helpOn | Should the help be shown at the beginning? |
| description | a character string indicating a desription text for the graph. |
| descriptionWidth | |
| | a percentage indicating a width for the description panel (25 by default). |
| roundedItems | Display items with rounded borders. |
| controls | a numeric vector indicating which controls will be shown. 1 = topbar, 2 = export buttons. NULL hide all controls, negative values deny each control and 0 deny all. |
| cex | number indicating the amount by which plotting text should be scaled relative to the default. |
| language | a character string indicating the language of the graph (en=english (default); es=spanish; ca=catalan). |
| dir | a character string representing the directory where the web files will be saved. |

## Value

Object of class `gallery_rd3`.

## Author(s)

Modesto Escobar, Department of Sociology and Communication, University of Salamanca. See <https://sociocav.usal.es/blog/modesto-escobar/>

## Examples

```
data("finches")
finches$species <- system.file("extdata", finches$species,
        package="netCoin") # copy path to the species field
gallery(finches, image="species", main="Species in Galapagos Islands",
        note="Data source: Sanderson (2000)")
```

---

glmCoin *Regression Graphs*

---

## Description

produces a netCoin object from a set of glm regressions.

## Usage

```
glmCoin(formulas, data, weights=NULL, pmax=.05,
                twotail=FALSE, showArrows=TRUE,
                frequency = FALSE, percentage = TRUE,
                color="variable", lwidth="z.value",
                circle= NA, language=c("en","es","ca"),
                igraph=FALSE, ...)
```

## Arguments

| | |
|---|---|
| formulas | A set of formulas separated, folowed by the family and a return. For example: model <- "counts ~ outcome + treatment, poisson counts ~ outcome, poisson" |
| data | Data frame containing the variables in the model. |
| weights | Optional vector of weights to be used in the fitting process. |
| pmax | Selection of links with Pr(>|z|) less than p (one-tail by default). |
| twotail | Logical value indicating if twotail test must be appied. Defaul=FALSE. |
| showArrows | a logical value true if the directional arrows are to be shown. Default = FALSE. |
| frequency | a logical value true if frequencies are to be shown. Default=FALSE. |
| percentage | a logical value true if percentages are to be shown. Default=TRUE. |
| color | Nodes' attribute to be used for expressing color ("variable" by default). |
| lwidth | Nodes' attribute to be used for widht of arrows ("z.value" by default). |
| circle | Degre of rotation in case of fixed circled dependent variables. |
| language | Language of the graph controls. |
| igraph | Produces an igraph object instead of a netCoin object if TRUE. |
| ... | Any [netCoin](#) argument. |

## Value

This function creates a netCoin object (or igraph) and, if stated, a folder in the computer with an HTML document named index.html which contains the produced graph. This file can be directly opened with your browser and sent to a web server to work properly.

## Author(s)

Modesto Escobar, Department of Sociology and Communication, University of Salamanca. See <https://sociocav.usal.es/blog/modesto-escobar/>

## Examples

```
## Dobson (1990) Page 93: Randomized Controlled Trial :
counts <- c(18,17,15,20,10,20,25,13,12)
outcome <- gl(3,1,9)
treatment <- gl(3,3)
Dobson <- data.frame(counts=counts, outcome=outcome, treatment=treatment)
model <- "counts ~ outcome + treatment, poisson"
glmCoin(model,Dobson)
```

---

incTime                    *Time incidences.*

---

### Description

Convert a data frame with two numbers (normally a beginning year and end year) into an incidences matrix whose rows are the intermediate numbers, and whose columns are the content of the names column.

### Usage

```
incTime(data, name = "name", beginning = "birth", end= "death")
```

### Arguments

| | |
|---|---|
| data | a data frame a name and two numbers. |
| name | Column with the names (default= "name"). |
| beginning | Column with the beginning number to include (default= "birth"). |
| end | Column with the end number to include (default= "death"). |

### Value

A data frame in which the two first columns are source and target. The rest of the columns are sim.=(1+threshold-real difference) and dist.=(difference between numbers)

### Author(s)

Modesto Escobar, Department of Sociology and Communication, University of Salamanca. See
https://sociocav.usal.es/blog/modesto-escobar/

### Examples

```
# From sociologists data
data("sociologists")
head(incTime(sociologists))[,1:5]
```

---

layoutCircle                          *Produce a circle layout of any number of nodes.*

---

### Description

layoutCircle produces a circle layout of any number of nodes.

### Usage

```
layoutCircle(N,nodes=seq_len(nrow(N)),deg=0,name=NULL)
```

### Arguments

| | |
|---|---|
| N | a data frame of nodes. |
| nodes | a vector specifing nodes. |
| deg | degrees to rotate. |
| name | name of column with node names. |

### Value

This function returns the input data frame of nodes with the resulting layout applied.

### Author(s)

Modesto Escobar, Department of Sociology and Communication, University of Salamanca. See
https://sociocav.usal.es/blog/modesto-escobar/

### Examples

```
A <- data.frame(name=letters)

L <- layoutCircle(A,name="name")

netCoin(A,layout=L)
```

---

layoutGrid                            *Produce a layout of any number of nodes.*

---

### Description

layoutGrid produces a grid layout of any number of nodes.

### Usage

```
layoutGrid(N,string,name=NULL,byrow=FALSE)
```

## Arguments

| | |
|---|---|
| N | a data frame of nodes. |
| string | a character vector specifing grouped nodes. |
| name | name of column with node names. |
| byrow | logical. If 'FALSE' (the default) the layout is filled by columns, otherwise the layout is filled by rows. |

## Value

This function returns the input data frame of nodes with the resulting layout applied.

## Author(s)

Modesto Escobar, Department of Sociology and Communication, University of Salamanca. See https://sociocav.usal.es/blog/modesto-escobar/

## Examples

```
A <- data.frame(name=letters)

L <- layoutGrid(A,"a,b,c,d,e.f,g,h,i,j.k,l,m,n,o,p.q,r,s,t,u.v,w,x,y,z","name")

netCoin(A,layout=L)
```

---

| links | *Data: Links between Italian families in the Renaissance.* |
|---|---|

---

## Description

Data frame with the marriage and business links.

## Usage

```
data("links")
```

## Format

A data frame with 36 links (rows) amongst 16 Italian families in the Renaissance.

Albizzi

Acciaiuoli

Barbadori

Bischeri

Castellani

Guadagni

```
Lamberteschi
Medici
Pazzi
Peruzzi
Ridolfi
Salviati
Strozzi
Tornabuoni
Ginori
Pucci
```
link  Type of link: marriage or business

### Source

PADGETT, J. F. Y C. K. ANSELL (1993): "Robust Action and the Rise of the Medici, 1400-1434", in American Journal of Sociology, 98, 1259-1319. (http://www.jstor.org/stable/2781822)

### Examples

```
data("links")
head(links)
```

---

| lower | *Similarity/distance matrix display.* |
|---|---|

---

### Description

Display the lower part of a matrix with a specified number of decimals.

### Usage

```
lower(matrix, decimals = 3)
```

### Arguments

| | |
|---|---|
| matrix | a symmetric similarity/distance matrix |
| decimals | number of decimals to be displayed |

### Value

A data frame of characters.

### Author(s)

Modesto Escobar, Department of Sociology and Communication, University of Salamanca. See https://sociocav.usal.es/blog/modesto-escobar/

## Examples

```
# From a random incidence matrix I(25X4)
I <- matrix(rbinom(100, 1, .5), nrow = 25, ncol = 4,
     dimnames = list(NULL, c("A", "B", "C", "D")))
lower(sim(I, "Jaccard"), 2)
```

| mobileEdges | *Mobile Edges.* |
|---|---|

## Description

Convert a data frame with one number (normally a year) into an edge list form with those whose numbers (years) have a difference lower or equal to a quantity.

## Usage

```
mobileEdges(data, name = 1, number = 2, difference=0)
```

## Arguments

| | |
|---|---|
| data | a data frame with a name and a number (year). |
| name | Column with the names (default= first column). |
| number | Column with the number (year) to compare (default= second column. |
| difference | Minimum difference between numbers of every two pair of names to create the edge or link (default=15). |

## Value

A data frame in which the two first columns are source and target. The rest of the columns are sim.=(1+threshold-real difference) and dist.=(difference between numbers)

## Author(s)

Modesto Escobar, Department of Sociology and Communication, University of Salamanca. See <https://sociocav.usal.es/blog/modesto-escobar/>

## Examples

```
# From a random incidence matrix I(25X4)
data("sociologists")
mobileEdges(sociologists)
```

---

multigraphCreate                     *Produce interactive multi graphs.*

---

### Description

`multigraphCreate` produce an interactive multi graph.

### Usage

```
multigraphCreate(..., mode = c("default","parallel","frame"),
                 frame = 0, speed = 50, dir = "MultiGraph", show = TRUE)
```

### Arguments

| | |
|---|---|
| `...` | rD3plot graphs (network_rd3, barplot_rd3, timeplot_rd3) objects or html "directories". |
| `mode` | a string specifying the displaying mode. The "default" displays graphs one by one, "parallel" splits screen and "frame" allows dinamic graphs in time. |
| `frame` | number of frame to start a dynamic network. |
| `speed` | a percentage for frame speed in dynamic networks. |
| `dir` | a "character" string representing the directory where the graph will be saved. |
| `show` | a logical value true if the graph is to be shown. Default = TRUE. |

### Value

The function creates a folder in your computer with an HTML document named index.html which contains the graph. This file can be directly opened with your browser.

### Author(s)

Modesto Escobar, Department of Sociology and Communication, University of Salamanca. See
https://sociocav.usal.es/blog/modesto-escobar/

### Examples

```
## Not run:
# A character column (with separator)
frame <- data.frame(A = c("Man; Women", "Women; Women",

```

---

netCoin                    *Networked coincidences.*

---

### Description

`netCoin` produces a netCoin object of coincidences. Its input has to be two data.frames: one of
attributes of events or nodes, and the other of attributes of the edges or links.

### Usage

```
netCoin(nodes = NULL, links = NULL, tree = NULL,
        community = NULL, layout = NULL,
        name = NULL, label = NULL, group = NULL, labelSize = NULL,
        size = NULL, color = NULL, shape = NULL, legend = NULL,
        sort = NULL, decreasing = FALSE, ntext = NULL, info = NULL,
        image = NULL, imageNames = NULL, centrality = NULL,
        nodeBipolar = FALSE, nodeFilter = NULL, degreeFilter = NULL,
        lwidth = NULL, lweight = NULL, lcolor = NULL, ltext = NULL,
        intensity = NULL, linkBipolar = FALSE, linkFilter = NULL,
        repulsion = 25, distance = 10, zoom = 1,
        fixed = showCoordinates, limits = NULL,
        main = NULL, note = NULL, showCoordinates = FALSE, showArrows = FALSE,
        showLegend = TRUE, frequencies = FALSE, showAxes = FALSE,
        axesLabels = NULL, scenarios = NULL, help = NULL, helpOn = FALSE,
        mode = c("network","heatmap"), controls = 1:4, cex = 1,
        background = NULL, defaultColor = "#1f77b4",
        language = c("en","es","ca"), dir = NULL)
```

### Arguments

| | |
|---|---|
| nodes | a data frame with at least one vector of names. |
| links | a data frame with at least two vectors with source and target, including names of nodes. |
| tree | a data frame with two vectors: source and target, describing relationships between nodes. |
| name | name of the vector with names in the nodes data frame. By default, if language="en", name is "name". |
| label | name of the vector with labels in the nodes data frame. |
| group | name of the vector with groups in the nodes data frame. |

| | |
|---|---|
| community | algorithm to make communities: edge_betweenness("ed"), fast_greedy("fa"), label_prop("la"), leiden_eigen("le"), louvain("lo"), optimal("op"), spinglass("sp"), walktrap("wa") |
| centrality | calculates the centrality measures of a network. See calCentr. |
| labelSize | name of the vector with label size in the nodes data frame. |
| size | name of the vector with size in the nodes data frame. |
| color | name of the vector with color variable in the nodes data frame. |
| shape | name of the vector with shape variable in the nodes data frame. |
| legend | name of the vector with the variable to represent as a legend in the nodes data frame. |
| ntext | name of the vector with html text in the nodes data frame. |
| info | name of the vector with information to display in a panel in the nodes data frame. |
| sort | name of the vector with node order in the nodes data frame (only for heatmap). |
| decreasing | decreasing or increasing sort of the nodes (only for heatmap). |
| intensity | name of the vector with intensity variable in the links data frame (only for heatmap). |
| lwidth | name of the vector with width variable in the links data frame. |
| lweight | name of the vector with weight variable in the links data frame. |
| lcolor | name of the vector with color variable in the links data frame. |
| ltext | name of the vector with labels in the links data frame. |
| nodeFilter | condition for filtering nodes. |
| linkFilter | condition for filtering links. |
| degreeFilter | numeric vector to filter the resulting network by degree. |
| nodeBipolar | a logical value that polarizes negative and positive node values in the graphical representation. Default = FALSE. |
| linkBipolar | a logical value that polarizes negative and positive link values in the graphical representation. Default = FALSE. |
| defaultColor | a character vector giving a valid html color. |
| repulsion | a percentage for repulsion between nodes. |
| distance | a percentage for distance of links. |
| zoom | a number between 0.1 and 10 to start displaying zoom. |
| fixed | prevent nodes from being dragged. |
| scenarios | a note showing number of scenarios. |
| main | upper title of the graph. |
| note | lower title of the graph. |
| frequencies | a logical value true if the frequencies can be shown in barplots. Default = FALSE. |
| help | help text of the graph. |
| helpOn | Should the help be shown at the beginning? |

| | |
|---|---|
| background | background color or image of the graph. |
| layout | a matrix with two columns or an algorithm to elaborate the coordinates: davidson.harel drl("da"), circle("ci"), Force-Atlas-2("fo"), fruchterman.reingold("fr"), gem("ge"), grid("gr"), kamada.kawai("ka"), lgl("lg"), mds("md"), random("ra"), reingold.tilford("re"), star("sta"), sugiyama("sug") |
| limits | vector indicating size references to display layout, must be a numeric vector of length 4: x1, y1, x2, y2. |
| cex | number indicating the amount by which plotting text should be scaled relative to the default. Default = 1. |
| controls | a numeric vector indicating which controls will be shown.  1 = sidebar, 2 = selection buttons, 3 = export buttons, 4 = nodes table, 5 = links table. NULL hide all controls, negative values deny each control and 0 deny all. |
| mode | a character vector indicating the graph mode allowed: network, heatmap or both (both by default). |
| showCoordinates | |
| | a logical value true if the coordinates are to be shown in tables and axes. Default = FALSE. |
| showArrows | a logical value true if the directional arrows are to be shown. Default = FALSE. |
| showLegend | a logical value true if the legend is to be shown. Default = TRUE. |
| showAxes | a logical value true if the axes are to be shown. Default = FALSE. |
| axesLabels | a character vector giving the axes names. |
| language | a character vector (es=spanish; en=english; ca=catalan). |
| image | name of the vector with image files in the nodes data frame. |
| imageNames | name of the vector with names for image files in the nodes data frame. |
| dir | a "character" string representing the directory where the web files will be saved. |

## Value

This function returns a netCoin object. If the 'dir' attribute is specified, the function creates a folder in the computer with an HTML document named index.html which contains the produced graph. This file can be directly opened with your browser and sent to a web server to work properly.

## Note

nodes and links arguments can be substituted by a netCoin object to add or change options to it.

## Author(s)

Modesto Escobar, Department of Sociology and Communication, University of Salamanca.  See https://sociocav.usal.es/blog/modesto-escobar/

## References

Escobar, M. and Martinez-Uribe, L. (2020) Network Coincidence Analysis: The netCoin R Package. *Journal of Statistical Software*, **93**, 1-32. doi: 10.18637/jss.v093.i11.

## Examples

```
# A character column (with separator)
frame <- data.frame(A = c("Man; Women", "Women; Women",
                          "Man; Man", "Undet.; Women; Man"))
data <- dichotomize(frame, "A", sep = "; ")[2:4]
C <- coin(data) # coincidence matrix
N <- asNodes(C) # node data frame
E <- edgeList(C) # edge data frame
netCoin(N, E) # netCoin object
```

---

netCorr                          *Networked correlations.*

---

## Description

`netCorr` produces a network object of correlations. Its input has to be at least one set of quantitative variables.

## Usage

```
netCorr(variables, weight=NULL, pairwise=FALSE,
        minimum=-Inf, maximum=Inf, sort=FALSE, decreasing=TRUE,
        frequency=FALSE, means=TRUE,
        method="pearson", criteria="p", Bonferroni=FALSE,
        minL=0, maxL=Inf,
        sortL=NULL, decreasingL=TRUE,
        igraph=FALSE, ...)
```

## Arguments

| | |
|---|---|
| variables | a data frame with at least two quantitative variables. |
| weight | a vector of weights. Optimal for data.framed tables |
| pairwise | Pairwise mode of handling missing values if TRUE. Listwise by default. |
| minimum | minimum frequency to be considered |
| maximum | maximum frequency to be considered |
| sort | sort the correlation matrix according to the frequency of the events |
| decreasing | decreasing or increasing sort of the matrix |
| frequency | a logical value true if frequencies are to be shown. Default=FALSE. |
| means | a logical value true if means are to be shown. Default=TRUE. |
| method | a vector of statistics of similarity. Pearson correlation by default. spearman and kendall are also possible |
| criteria | statistic to be use for selection criteria. |
| Bonferroni | Bonferroni criterium of the signification test. |
| minL | minimum value of the statistic to include the edge in the list. |

| maxL | maximum value of the statistic to include the edge in the list. |
|------|------|
| sortL | sort the list according to the values of a statistic. See below |
| decreasingL | order in a decreasing way. |
| igraph | Produces an igraph object instead of a netCoin object if TRUE |
| ... | Any netCoin argument. |

## Value

The function creates a netCoin object and eventually a folder in the computer with an HTML document named index.html which contains the produced graph. This file can be directly opened with your browser and sent to a web server to work properly.

## Author(s)

Modesto Escobar, Department of Sociology and Communication, University of Salamanca. See https://sociocav.usal.es/blog/modesto-escobar/

## Examples

```
# A character column (with separator)
data(iris)
netCorr(iris[,1:4],ltext="value",
 main="Correlations between measurements of Iris Species",
 note="Anderson, Edgar (1935) y Fisher, R. A. (1936)") # network object
```

---

| pathCoin | *Structural Equation Models Graphs.* |
|----------|------|

---

## Description

pathCoin produces a netCoin object from a lavaan object, i.e., parameters of structural equation model.

## Usage

```
pathCoin(model, estimates=c("b","se","z","pvalue","beta"),
        fitMeasures=c("chisq", "cfi", "rmsea"), ...)
```

## Arguments

| model | a lavaan object. |
|-------|------|
| estimates | A vector with at least one element amongst "b", "se", "z", "pvalue", "beta". |
| fitMeasures | Default values: "chisq", "df", "pvalue", "cfi", "rmsea" |
| ... | Any netCoin argument. |

## Value

The function creates a netCoin object and eventually a folder in the computer with an HTML document named index.html which contains the produced graph. This file can be directly opened with your browser and sent to a web server to work properly.

## Author(s)

Modesto Escobar, Department of Sociology and Communication, University of Salamanca. See https://sociocav.usal.es/blog/modesto-escobar/

## Examples

```
# Classic Wheaton et al. model
library(lavaan)
lower <- '
11.834
6.947 9.364
6.819 5.091 12.532
4.783 5.028 7.495 9.986
-3.839 -3.889 -3.841 -3.625 9.610
-21.899 -18.831 -21.748 -18.775 35.522 450.288 '
wheaton.cov <- getCov(lower,
              names = c("anomia67", "powerless67","anomia71", "powerless71",
                        "education", "sei"))
wheaton.model <- '
# latent variables
ses =~ education + sei
alien67 =~ anomia67 + powerless67
alien71 =~ anomia71 + powerless71
# regressions
alien71 ~ alien67 + ses
alien67 ~ ses
# correlated residuals
anomia67 ~~ anomia71
powerless67 ~~ powerless71
'
fit <- sem(wheaton.model, sample.cov = wheaton.cov, sample.nobs = 932)

pathCoin(fit)
```

---

| propCoin | *Express Coin Entries as Fraction of Marginal Table* |
|---|---|

---

## Description

This is like 'prop.table' for 'coin' objects.

## Usage

```
propCoin(x, margin= 0, decimals=1)
```

## Arguments

| | |
|---|---|
| x | 'coin' object. |
| margin | index, or vector of indices to generate margin for. |
| decimals | integer indicating the number of decimal places to be used. |

## Value

Table like 'x' expressed relative to 'margin'.

## Author(s)

Modesto Escobar, Department of Sociology and Communication, University of Salamanca. See https://sociocav.usal.es/blog/modesto-escobar/

## Examples

```
## Random incidence matrix: 25 scenarios, 4 events.
I <- matrix(rbinom(100, 1, .5), nrow = 25, ncol = 4,
           dimnames = list(NULL, c("A", "B", "C", "D")))
C <- coin(I, sort = TRUE)

propCoin(C, 1)
```

---

| saveGhml | *Save a netCoin object as a .graphml file to be read in Gephi, Pajek, ...* |
|---|---|

---

## Description

saveGhml produces a .graphml file from a netCoin object.

## Usage

```
saveGhml(net, file="netCoin.graphml")
```

## Arguments

| | |
|---|---|
| net | A netCoin object. |
| file | The name of the file. If not extension, .gexf is used as default. |

## Value

The function creates a file with vertices and arcs or edges of a netCoin object.

## Author(s)

Modesto Escobar, Department of Sociology and Communication, University of Salamanca. See https://sociocav.usal.es/blog/modesto-escobar/

## Examples

```
## Not run:
# A character column (with separator)
frame <- data.frame(A = c("Man; Women", "Women; Women",
                          "Man; Man", "Undet.; Women; Man"))
data <- dichotomize(frame, "A", add=FALSE, sep = "; ")
graph <- allNet(data, maxL=.5) # graph from an incidence matrix

saveGhml(graph,"graph") # save graph.net file

## End(Not run)
```

---

savePajek                    *Save a netCoin object as a .net (.paj) file to be read in Pajek, Gephi, ...*

---

## Description

savePajek produces a .net (.paj) file from a netCoin object.

## Usage

```
savePajek(net, file="file.net", arcs=NULL, edges=NULL,
          partitions=NULL, vectors=NULL)
```

## Arguments

| | |
|---|---|
| net | a netCoin object. |
| file | The name of the file without extension. It will be .net or .paj acoording to data. The default is file.net or file.paj |
| arcs | Names of netCoin$links to be included and considered as arcs in the Pajek file.. |
| edges | Names of netCoin$links to be included and considered as edges in the Pajek file.. |
| partitions | Names of netCoin$nodes to be included and considered as partitions in the Pajek file. |
| vectors | Names of netCoin$nodes to be included and considered as vectors in the Pajek file. |

## Value

The function creates a file with vertices and arcs or edges of a netCoin objetct. Vectors and partitions can be also included. .

## Author(s)

Modesto Escobar, Department of Sociology and Communication, University of Salamanca. See https://sociocav.usal.es/blog/modesto-escobar/

## Examples

```
## Not run:
# A character column (with separator)
frame <- data.frame(A = c("Man; Women", "Women; Women",
                          "Man; Man", "Undet.; Women; Man"))
data <- dichotomize(frame, "A", add=FALSE, sep = "; ")
graph <- allNet(data) # graph from an incidence matrix

savePajek(graph,"graph",edges="Haberman") # save graph.net file

## End(Not run)
```

---

shinyCoin                    *Include netCoin Plots in Shiny.*

---

## Description

Load a netCoin plot to display in shiny.

## Usage

```
shinyCoin(x)
```

## Arguments

x               is a netCoin, barCoin or timeCoin object.

## Author(s)

Modesto Escobar, Department of Sociology and Communication, University of Salamanca. See
https://sociocav.usal.es/blog/modesto-escobar/

## Examples

```
## Not run:
# A character column (with separator)
frame <- data.frame(A = c("Man; Women", "Women; Women",
                          "Man; Man", "Undet.; Women; Man"))
data <- dichotomize(frame, "A", sep="; ")[2:4]
C <- coin(data) # coincidence matrix
N <- asNodes(C) # node data frame
E <- edgeList(C) # edge data frame
net <- netCoin(N, E) # netCoin object
shinyCoin(net)

## End(Not run)
```

---

sim *Similarity matrix.*

---

### Description

It calculates a similarity/distance matrix from either an incidence data frame/matrix or a coin object.

### Usage

```
sim(input, procedures="Jaccard", level=.95, distance=FALSE,
    minimum=1, maximum=Inf, sort=FALSE, decreasing=FALSE,
    weight = NULL, pairwise = FALSE)
```

### Arguments

| | |
|---|---|
| input | a binary data frame or a coin object, let's say an R list composed by a number of scenarios ($n) and a coincidence matrix with frequencies ($f). |
| procedures | a vector of statistics of similarity. See details below. |
| level | confidence level |
| distance | convert the similarity matrix into a distance matrix |
| minimum | minimum frequency to obtain a similarity/distance measure. |
| maximum | maxium frequency to obtain a similarity/distance measure. |
| sort | sort the list according to the values of a statistic. See details below |
| decreasing | order in a decreasing way. |
| weight | a vector of weights. Optimal for data.framed tables |
| pairwise | Pairwise mode of handling missing values if TRUE. Listwise by default. |

### Details

Possible measures in procedures are

- Frequencies (f), Relative frequencies (x), Conditional frequencies (i), Coincidence degree (cc), Probable degree (cp),
- Expected (e), Confidence interval (con)
- Matching (m), Rogers & Tanimoto (t), Gower (g), Sneath (s), Anderberg (and),
- Jaccard (j), Dice (d), antiDice (a), Ochiai (o), Kulczynski (k),
- Hamann (ham), Yule (y), Pearson (p), odds ratio (od), Rusell (r),
- Haberman (h), Z value of Haberman (z).
- Hypergeometric p greater value (hyp).

### Value

A similarity/distance matrix.

## Author(s)

Modesto Escobar, Department of Sociology and Communication, University of Salamanca. See https://sociocav.usal.es/blog/modesto-escobar/

## Examples

```
# From a random incidence matrix I(25X4)
I<-matrix(rbinom(100,1,.5),nrow=25,ncol=4,
   dimnames=list(NULL,c("A","B","C","D")))
sim(I)
#Same results
C<-coin(I)
sim(C)
```

---

| sociologists | *Data: Classical sociologists.* |
|---|---|

---

## Description

Data frame with names, birth and death year data, birth country and movement.

## Usage

```
data("sociologists")
```

## Format

A data frame with life's period of 16 sociologists and the following 11 variables to study time coincidences:

name : name and last name of the sociologist.

birth : birth year.

death : death year.

birth_place : birth place.

birth_country : birth country.

death_place : death place.

death_country : death country.

label : combination of name, birth and death dates.

generation : generation (every 25 years) of the sociologists.

school : school of thought.

picture : name of the file where their picture is.

## Source

Own elaboration from manuals of sociology.

## References

See `events`.

## Examples

```
data(sociologists)
head(sociologists, 10)
tail(sociologists, 10)
```

---

surCoin                          *Networked coincidences from a data frame.*

---

## Description

`surCoin` produces a network object of coincidences from a data frame converting variables into dichotomies.

## Usage

```
surCoin(data,variables=names(data), commonlabel=NULL,
        dichotomies=NULL, valueDicho=1, metric=NULL, exogenous=NULL,
        weight=NULL, subsample=FALSE, pairwise=FALSE,
        minimum=1, maximum=nrow(data), sort=FALSE, decreasing=TRUE,
        frequency=FALSE, percentages=TRUE,
        procedures="Haberman", criteria="Z", Bonferroni=FALSE,
        support=-Inf, minL=-Inf, maxL=Inf,
        directed=FALSE, diagonal=FALSE, sortL=NULL, decreasingL=TRUE,
        igraph=FALSE, coin=FALSE, dir=NULL, ...)
```

## Arguments

| | |
|---|---|
| data | a data frame. |
| variables | a vector of variables included in the previous data frame. |
| commonlabel | a vector of variables whose names are to be included in nodes labels. |
| dichotomies | a vector of dichotomous variables to appear as just one category. |
| valueDicho | value or list of values (not vector) to be selected for dichotomous variables. Default is 1. |
| metric | a vector of metrics. |
| exogenous | a vector of variables whose relations amongst them are of no interest. None by default. |
| weight | a vector of weights. Optimal for data.framed tables. |
| subsample | retrict the analysis to scenarios with at least one event. |
| pairwise | Pairwise mode of handling missing values if TRUE. Listwise by default. |
| minimum | minimum frequency to be considered. |

| | |
|---|---|
| maximum | maximum frequency to be considered. |
| sort | sort the coincidence matrix according to frequency of events. |
| decreasing | decreasing or increasing sort of the matrix. |
| frequency | a logical value true if frequencies are to be shown. Default=FALSE. |
| percentages | a logical value true if percentages are to be shown. Default=TRUE. |
| procedures | a vector of statistics of similarity. See below. |
| criteria | statistic to be use for selection criteria. |
| Bonferroni | Bonferroni criterium of the signification test. |
| support | minimum value of the frequency of the coincidence to be edged. |
| minL | minimum value of the statistic to include the edge in the list. |
| maxL | maximum value of the statistic to include the edge in the list. By default is +Inf, except if criteria="Z" or criteria="hyp", in which case it is .5. It is recommnended to change it to .05 if data has been sampled. |
| directed | includes same edges only once. |
| diagonal | includes auto-links. |
| sortL | sort the list according to the values of a statistic. See below. |
| decreasingL | order in a decreasing way. |
| igraph | Produces an igraph object instead of a netCoin object if TRUE. |
| coin | Only return the coincidences matrix if TRUE. |
| dir | a "character" string representing the directory where the web files will be saved. |
| ... | Any [netCoin](#) argument. |

### Details

Possible measures in procedures are

- Frequencies (f), Relative frequencies (x), Conditional frequencies (i), Coincidence degree (cc), Probable degree (cp),
- Expected (e), Confidence interval (con)
- Matching (m), Rogers & Tanimoto (t), Gower (g), Sneath (s), Anderberg (and),
- Jaccard (j), Dice (d), antiDice (a), Ochiai (o), Kulczynski (k),
- Hamann (ham), Yule (y), Pearson (p), odds ratio (od), Rusell (r),
- Haberman (h), Z value of Haberman (z),
- Hypergeometric p greater value (hyp).
- Convert a matrix into an edge list (shape).

### Value

This function creates a netCoin object (or igraph) and, if stated, a folder in the computer with an HTML document named index.html which contains the produced graph. This file can be directly opened with your browser and sent to a web server to work properly.

```

---

surScat                          *Networked coincidences from a data frame.*

---

## Description

surScat produces a network object of coincidences from a data frame converting variables into dichotomies.

## Usage

```
surScat(data, variables=names(data), active=variables, type=c("mca", "pca"), nclusters=2,
        maxN=2000, ...)
```

## Arguments

| | |
|---|---|
| data | a data frame. |
| variables | a vector of variables included in the previous data frame. |
| active | a vector of variables actived in the previous data frame. |

| type | Factorial type: mca for qualitative active variables, pca for quantitative active variables. |
| --- | --- |
| nclusters | number of clusters. |
| maxN | Maximum number or rows. |
| ... | Any netCoin argument. |

## Details

Possible measures in procedures are

- Frequencies (f), Relative frequencies (x), Conditional frequencies (i), Coincidence degree (cc), Probable degree (cp),
- Expected (e), Confidence interval (con)
- Matching (m), Rogers & Tanimoto (t), Gower (g), Sneath (s), Anderberg (and),
- Jaccard (j), Dice (d), antiDice (a), Ochiai (o), Kulczynski (k),
- Hamann (ham), Yule (y), Pearson (p), odds ratio (od), Rusell (r),
- Haberman (h), Z value of Haberman (z),
- Hypergeometric p greater value (hyp).
- Convert a matrix into an edge list (shape).

## Value

This function creates a netCoin object (or igraph) and, if stated, a folder in the computer with an HTML document named index.html which contains the produced graph. This file can be directly opened with your browser and sent to a web server to work properly.

## Author(s)

Modesto Escobar, Department of Sociology and Communication, University of Salamanca. See https://sociocav.usal.es/blog/modesto-escobar/

## References

Escobar, M. and Martinez-Uribe, L. (2020) Network Coincidence Analysis: The netCoin R Package. *Journal of Statistical Software*, **93**, 1-32. doi: 10.18637/jss.v093.i11.

## Examples

```
# A data frame with two variables Gender and Opinion
frame<-data.frame(Gender=c(rep("Man",3),rep("Woman",3)),
                  Opinion=c("Yes","Yes","No","No","No","Yes"))
surScat(frame) # network object
```

---

timeCoin                          *Networked coincidences.*

---

### Description

timeCoin produces a timeCoin object.

### Usage

```
timeCoin(periods, name = "name", start = "start", end = "end", group = NULL,
         text = NULL, main = NULL, note = NULL, info = NULL,
         events = NULL, eventNames = "name", eventPeriod = "period",
         eventTime = "date", eventColor = NULL, eventShape = NULL,
         cex = 1, language = c("en","es","ca"), dir = NULL)
```

### Arguments

| | |
|---|---|
| periods | a data frame with at least three vectors of name, start and end of the periods. |
| name | name of the vector with names in the periods data frame. |
| start | name of the vector with starts in the periods data frame. |
| end | name of the vector with ends in the periods data frame. |
| group | name of the vector with groups in the periods data frame. |
| text | name of the vector with html text in the periods data frame. |
| main | upper title of the graph. |
| note | lower title of the graph. |
| info | name of the vector with information to display in a panel in the periods data frame. |
| events | a data frame of events included into the periods with three columns: event name, periodParent and eventTime |
| eventNames | name of the vector with names in the events data frame. |
| eventPeriod | name of the vector with period names in the events data frame. |
| eventTime | name of the vector with time points in the events data frame. |
| eventColor | name of the vector with color criteria in the events data frame. |
| eventShape | name of the vector with shape criteria in the events data frame. |
| cex | number indicating the amount by which plotting text should be scaled relative to the default. Default = 1. |
| language | a character vector (es=spanish; en=english; ca=catalan). |
| dir | a "character" string representing the directory where the web files will be saved. |

### Value

Object of class timeCoin.

## Author(s)

Modesto Escobar, Department of Sociology and Communication, University of Salamanca. See
https://sociocav.usal.es/blog/modesto-escobar/

## Examples

```
# Database of the classical sociologists.
# Only periods
data(sociologists)
timeCoin(sociologists, "name", "birth", "death", "school")

# Periods and events
data(works)
timeCoin(sociologists, "name", "birth", "death", "school",
        events=works, eventNames="label", eventPeriod="author", eventTime="date")
```

---

| toIgraph | *igraph object.* |
|----------|------------------|

---

## Description

igraph object from a `network_rd3` object.

## Usage

```
toIgraph(net)
```

## Arguments

net          is a `network_rd3` object. See `network_rd3`

## Value

An `igraph` object.

## Author(s)

Modesto Escobar, Department of Sociology and Communication, University of Salamanca. See
https://sociocav.usal.es/blog/modesto-escobar/

## Examples

```
# A character column (with separator)
frame <- data.frame(A = c("Man; Women", "Women; Women",
                          "Man; Man", "Undet.; Women; Man"))
data <- dichotomize(frame, "A", sep = "; ")[2:4]
C <- coin(data) # coincidence matrix
N <- asNodes(C) # node data frame
E <- edgeList(C)
```

```
net <- netCoin(N, E)
toIgraph(net) # conversion into a igraph object
```

---

works                          *Data: Classical sociological works.*

---

### Description

Data frame with classical sociological works writen by authors in the sociologists data frame.

### Usage

```
data("sociologists")
```

### Format

A data frame with 54 observations (events) and the following 4 variables to study coincidences in time:

name : name and last name of the author of the work.

label : abbreviation of the complete name.

works : work's name.

date : year of its first publication.

### Author(s)

Modesto Escobar, Department of Sociology and Communication, University of Salamanca. See https://sociocav.usal.es/blog/modesto-escobar/

### Source

Own elaboration from manuals of sociology.

### References

See events.

### Examples

```
data(works)
head(works, 10)
tail(works, 10)
```
