

# Package ‘paws.machine.learning’

October 14, 2022

**Title** 'Amazon Web Services' Machine Learning Services

**Version** 0.1.12

**Description** Interface to 'Amazon Web Services' machine learning services, including 'SageMaker' managed machine learning service, natural language processing, speech recognition, translation, and more  
<<https://aws.amazon.com/machine-learning/>>.

**License** Apache License (>= 2.0)

**URL** <https://github.com/paws-r/paws>

**BugReports** <https://github.com/paws-r/paws/issues>

**Imports** paws.common (>= 0.3.0)

**Suggests** testthat

**Encoding** UTF-8

comprehend

*Amazon Comprehend*

---

## Description

Amazon Comprehend is an AWS service for gaining insight into the content of documents. Use these actions to determine the topics contained in your documents, the topics they discuss, the predominant sentiment expressed in them, the predominant language used, and more.

**Usage**

```
comprehend(config = list())
```

**Arguments**

config            Optional configuration of credentials, endpoint, and/or region.

**Value**

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

**Service syntax**

```
svc <- comprehend(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string"
    ),
    endpoint = "string",
    region = "string"
  )
)
```

**Operations**

<a href="#">batch_detect_dominant_language</a>	Determines the dominant language of the input text for a batch of documents
<a href="#">batch_detect_entities</a>	Inspects the text of a batch of documents for named entities and returns information
<a href="#">batch_detect_key_phrases</a>	Detects the key noun phrases found in a batch of documents
<a href="#">batch_detect_sentiment</a>	Inspects a batch of documents and returns an inference of the prevailing sentiment
<a href="#">batch_detect_syntax</a>	Inspects the text of a batch of documents for the syntax and part of speech of the
<a href="#">classify_document</a>	Creates a new document classification request to analyze a single document in a
<a href="#">create_document_classifier</a>	Creates a new document classifier that you can use to categorize documents
<a href="#">create_endpoint</a>	Creates a model-specific endpoint for synchronous inference for a previously trained
<a href="#">create_entity_recognizer</a>	Creates an entity recognizer using submitted files
<a href="#">delete_document_classifier</a>	Deletes a previously created document classifier
<a href="#">delete_endpoint</a>	Deletes a model-specific endpoint for a previously-trained custom model
<a href="#">delete_entity_recognizer</a>	Deletes an entity recognizer
<a href="#">describe_document_classification_job</a>	Gets the properties associated with a document classification job
<a href="#">describe_document_classifier</a>	Gets the properties associated with a document classifier
<a href="#">describe_dominant_language_detection_job</a>	Gets the properties associated with a dominant language detection job
<a href="#">describe_endpoint</a>	Gets the properties associated with a specific endpoint

<code>describe_entities_detection_job</code>	Gets the properties associated with an entities detection job
<code>describe_entity_recognizer</code>	Provides details about an entity recognizer including status, S3 buckets contain
<code>describe_events_detection_job</code>	Gets the status and details of an events detection job
<code>describe_key_phrases_detection_job</code>	Gets the properties associated with a key phrases detection job
<code>describe_pii_entities_detection_job</code>	Gets the properties associated with a PII entities detection job
<code>describe_sentiment_detection_job</code>	Gets the properties associated with a sentiment detection job
<code>describe_topics_detection_job</code>	Gets the properties associated with a topic detection job
<code>detect_dominant_language</code>	Determines the dominant language of the input text
<code>detect_entities</code>	Inspects text for named entities, and returns information about them
<code>detect_key_phrases</code>	Detects the key noun phrases found in the text
<code>detect_pii_entities</code>	Inspects the input text for entities that contain personally identifiable information
<code>detect_sentiment</code>	Inspects text and returns an inference of the prevailing sentiment (POSITIVE, NEUTRAL, NEGATIVE)
<code>detect_syntax</code>	Inspects text for syntax and the part of speech of words in the document
<code>list_document_classification_jobs</code>	Gets a list of the documentation classification jobs that you have submitted
<code>list_document_classifiers</code>	Gets a list of the document classifiers that you have created
<code>list_dominant_language_detection_jobs</code>	Gets a list of the dominant language detection jobs that you have submitted
<code>list_endpoints</code>	Gets a list of all existing endpoints that you've created
<code>list_entities_detection_jobs</code>	Gets a list of the entity detection jobs that you have submitted
<code>list_entity_recognizers</code>	Gets a list of the properties of all entity recognizers that you created, including
<code>list_events_detection_jobs</code>	Gets a list of the events detection jobs that you have submitted
<code>list_key_phrases_detection_jobs</code>	Get a list of key phrase detection jobs that you have submitted
<code>list_pii_entities_detection_jobs</code>	Gets a list of the PII entity detection jobs that you have submitted
<code>list_sentiment_detection_jobs</code>	Gets a list of sentiment detection jobs that you have submitted
<code>list_tags_for_resource</code>	Lists all tags associated with a given Amazon Comprehend resource
<code>list_topics_detection_jobs</code>	Gets a list of the topic detection jobs that you have submitted
<code>start_document_classification_job</code>	Starts an asynchronous document classification job
<code>start_dominant_language_detection_job</code>	Starts an asynchronous dominant language detection job for a collection of documents
<code>start_entities_detection_job</code>	Starts an asynchronous entity detection job for a collection of documents
<code>start_events_detection_job</code>	Starts an asynchronous event detection job for a collection of documents
<code>start_key_phrases_detection_job</code>	Starts an asynchronous key phrase detection job for a collection of documents
<code>start_pii_entities_detection_job</code>	Starts an asynchronous PII entity detection job for a collection of documents
<code>start_sentiment_detection_job</code>	Starts an asynchronous sentiment detection job for a collection of documents
<code>start_topics_detection_job</code>	Starts an asynchronous topic detection job
<code>stop_dominant_language_detection_job</code>	Stops a dominant language detection job in progress
<code>stop_entities_detection_job</code>	Stops an entities detection job in progress
<code>stop_events_detection_job</code>	Stops an events detection job in progress
<code>stop_key_phrases_detection_job</code>	Stops a key phrases detection job in progress
<code>stop_pii_entities_detection_job</code>	Stops a PII entities detection job in progress
<code>stop_sentiment_detection_job</code>	Stops a sentiment detection job in progress
<code>stop_training_document_classifier</code>	Stops a document classifier training job while in progress
<code>stop_training_entity_recognizer</code>	Stops an entity recognizer training job while in progress
<code>tag_resource</code>	Associates a specific tag with an Amazon Comprehend resource
<code>untag_resource</code>	Removes a specific tag associated with an Amazon Comprehend resource
<code>update_endpoint</code>	Updates information about the specified endpoint

## Examples

```
## Not run:
svc <- comprehend()
svc$batch_detect_dominant_language(
  Foo = 123
)

## End(Not run)
```

---

comprehendmedical	<i>AWS Comprehend Medical</i>
-------------------	-------------------------------

---

## Description

Amazon Comprehend Medical extracts structured information from unstructured clinical text. Use these actions to gain insight in your documents.

## Usage

```
comprehendmedical(config = list())
```

## Arguments

`config` Optional configuration of credentials, endpoint, and/or region.

## Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

## Service syntax

```
svc <- comprehendmedical(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string"
    ),
    endpoint = "string",
    region = "string"
  )
)
```

## Operations

<a href="#">describe_entities_detection_v2_job</a>	Gets the properties associated with a medical entities detection job
<a href="#">describe_icd10cm_inference_job</a>	Gets the properties associated with an InferICD10CM job
<a href="#">describe_phi_detection_job</a>	Gets the properties associated with a protected health information (PHI) detection job
<a href="#">describe_rx_norm_inference_job</a>	Gets the properties associated with an InferRxNorm job
<a href="#">detect_entities</a>	The DetectEntities operation is deprecated
<a href="#">detect_entities_v2</a>	Inspects the clinical text for a variety of medical entities and returns specific information
<a href="#">detect_phi</a>	Inspects the clinical text for protected health information (PHI) entities and returns the entities
<a href="#">infer_icd10cm</a>	InferICD10CM detects medical conditions as entities listed in a patient record and links to the entities
<a href="#">infer_rx_norm</a>	InferRxNorm detects medications as entities listed in a patient record and links to the entities
<a href="#">list_entities_detection_v2_jobs</a>	Gets a list of medical entity detection jobs that you have submitted
<a href="#">list_icd10cm_inference_jobs</a>	Gets a list of InferICD10CM jobs that you have submitted
<a href="#">list_phi_detection_jobs</a>	Gets a list of protected health information (PHI) detection jobs that you have submitted
<a href="#">list_rx_norm_inference_jobs</a>	Gets a list of InferRxNorm jobs that you have submitted
<a href="#">start_entities_detection_v2_job</a>	Starts an asynchronous medical entity detection job for a collection of documents
<a href="#">start_icd10cm_inference_job</a>	Starts an asynchronous job to detect medical conditions and link them to the ICD-10-CM entities
<a href="#">start_phi_detection_job</a>	Starts an asynchronous job to detect protected health information (PHI)
<a href="#">start_rx_norm_inference_job</a>	Starts an asynchronous job to detect medication entities and link them to the RxNorm entities
<a href="#">stop_entities_detection_v2_job</a>	Stops a medical entities detection job in progress
<a href="#">stop_icd10cm_inference_job</a>	Stops an InferICD10CM inference job in progress
<a href="#">stop_phi_detection_job</a>	Stops a protected health information (PHI) detection job in progress
<a href="#">stop_rx_norm_inference_job</a>	Stops an InferRxNorm inference job in progress

## Examples

```
## Not run:
svc <- comprehendmedical()
svc$describe_entities_detection_v2_job(
  Foo = 123
)

## End(Not run)
```

---

lexmodelbuildingservice

*Amazon Lex Model Building Service*

---

## Description

Amazon Lex Build-Time Actions

Amazon Lex is an AWS service for building conversational voice and text interfaces. Use these actions to create, update, and delete conversational bots for new and existing client applications.

**Usage**

```
lexmodelbuildingservice(config = list())
```

**Arguments**

config            Optional configuration of credentials, endpoint, and/or region.

**Value**

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

**Service syntax**

```
svc <- lexmodelbuildingservice(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string"
    ),
    endpoint = "string",
    region = "string"
  )
)
```

**Operations**

<a href="#">create_bot_version</a>	Creates a new version of the bot based on the \$LATEST version
<a href="#">create_intent_version</a>	Creates a new version of an intent based on the \$LATEST version of the intent
<a href="#">create_slot_type_version</a>	Creates a new version of a slot type based on the \$LATEST version of the specified slot type
<a href="#">delete_bot</a>	Deletes all versions of the bot, including the \$LATEST version
<a href="#">delete_bot_alias</a>	Deletes an alias for the specified bot
<a href="#">delete_bot_channel_association</a>	Deletes the association between an Amazon Lex bot and a messaging platform
<a href="#">delete_bot_version</a>	Deletes a specific version of a bot
<a href="#">delete_intent</a>	Deletes all versions of the intent, including the \$LATEST version
<a href="#">delete_intent_version</a>	Deletes a specific version of an intent
<a href="#">delete_slot_type</a>	Deletes all versions of the slot type, including the \$LATEST version
<a href="#">delete_slot_type_version</a>	Deletes a specific version of a slot type
<a href="#">delete_utterances</a>	Deletes stored utterances
<a href="#">get_bot</a>	Returns metadata information for a specific bot
<a href="#">get_bot_alias</a>	Returns information about an Amazon Lex bot alias
<a href="#">get_bot_aliases</a>	Returns a list of aliases for a specified Amazon Lex bot
<a href="#">get_bot_channel_association</a>	Returns information about the association between an Amazon Lex bot and a messaging platform

<a href="#">get_bot_channel_associations</a>	Returns a list of all of the channels associated with the specified bot
<a href="#">get_bots</a>	Returns bot information as follows:
<a href="#">get_bot_versions</a>	Gets information about all of the versions of a bot
<a href="#">get_builtin_intent</a>	Returns information about a built-in intent
<a href="#">get_builtin_intents</a>	Gets a list of built-in intents that meet the specified criteria
<a href="#">get_builtin_slot_types</a>	Gets a list of built-in slot types that meet the specified criteria
<a href="#">get_export</a>	Exports the contents of a Amazon Lex resource in a specified format
<a href="#">get_import</a>	Gets information about an import job started with the StartImport operation
<a href="#">get_intent</a>	Returns information about an intent
<a href="#">get_intents</a>	Returns intent information as follows:
<a href="#">get_intent_versions</a>	Gets information about all of the versions of an intent
<a href="#">get_slot_type</a>	Returns information about a specific version of a slot type
<a href="#">get_slot_types</a>	Returns slot type information as follows:
<a href="#">get_slot_type_versions</a>	Gets information about all versions of a slot type
<a href="#">get_utterances_view</a>	Use the GetUtterancesView operation to get information about the utterances that your user
<a href="#">list_tags_for_resource</a>	Gets a list of tags associated with the specified resource
<a href="#">put_bot</a>	Creates an Amazon Lex conversational bot or replaces an existing bot
<a href="#">put_bot_alias</a>	Creates an alias for the specified version of the bot or replaces an alias for the specified bot
<a href="#">put_intent</a>	Creates an intent or replaces an existing intent
<a href="#">put_slot_type</a>	Creates a custom slot type or replaces an existing custom slot type
<a href="#">start_import</a>	Starts a job to import a resource to Amazon Lex
<a href="#">tag_resource</a>	Adds the specified tags to the specified resource
<a href="#">untag_resource</a>	Removes tags from a bot, bot alias or bot channel

## Examples

```
## Not run:
svc <- lexmodelbuildingservice()
# This example shows how to get configuration information for a bot.
svc$get_bot(
  name = "DocOrderPizza",
  versionOrAlias = "$LATEST"
)

## End(Not run)
```

## Description

Amazon Lex provides both build and runtime endpoints. Each endpoint provides a set of operations (API). Your conversational bot uses the runtime API to understand user utterances (user input text or voice). For example, suppose a user says "I want pizza", your bot sends this input to Amazon Lex

using the runtime API. Amazon Lex recognizes that the user request is for the OrderPizza intent (one of the intents defined in the bot). Then Amazon Lex engages in user conversation on behalf of the bot to elicit required information (slot values, such as pizza size and crust type), and then performs fulfillment activity (that you configured when you created the bot). You use the build-time API to create and manage your Amazon Lex bot. For a list of build-time operations, see the build-time API, .

## Usage

```
lexruntime-service(config = list())
```

## Arguments

`config` Optional configuration of credentials, endpoint, and/or region.

## Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

## Service syntax

```
svc <- lexruntime-service(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string"
    ),
    endpoint = "string",
    region = "string"
  )
)
```

## Operations

<a href="#">delete_session</a>	Removes session information for a specified bot, alias, and user ID
<a href="#">get_session</a>	Returns session information for a specified bot, alias, and user ID
<a href="#">post_content</a>	Sends user input (text or speech) to Amazon Lex
<a href="#">post_text</a>	Sends user input to Amazon Lex
<a href="#">put_session</a>	Creates a new session or modifies an existing session with an Amazon Lex bot

## Examples

```
## Not run:
svc <- lexruntimeservice()
svc$delete_session(
  Foo = 123
)

## End(Not run)
```

---

machinelearning

*Amazon Machine Learning*

---

## Description

Definition of the public APIs exposed by Amazon Machine Learning

## Usage

```
machinelearning(config = list())
```

## Arguments

`config` Optional configuration of credentials, endpoint, and/or region.

## Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

## Service syntax

```
svc <- machinelearning(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string"
    ),
    endpoint = "string",
    region = "string"
  )
)
```

**Operations**

<code>add_tags</code>	Adds one or more tags to an object, up to a limit of 10
<code>create_batch_prediction</code>	Generates predictions for a group of observations
<code>create_data_source_from_rds</code>	Creates a DataSource object from an Amazon Relational Database Service (Amazon RDS)
<code>create_data_source_from_redshift</code>	Creates a DataSource from a database hosted on an Amazon Redshift cluster
<code>create_data_source_from_s3</code>	Creates a DataSource object
<code>create_evaluation</code>	Creates a new Evaluation of an MLModel
<code>create_ml_model</code>	Creates a new MLModel using the DataSource and the recipe as information sources
<code>create_realtime_endpoint</code>	Creates a real-time endpoint for the MLModel
<code>delete_batch_prediction</code>	Assigns the DELETED status to a BatchPrediction, rendering it unusable
<code>delete_data_source</code>	Assigns the DELETED status to a DataSource, rendering it unusable
<code>delete_evaluation</code>	Assigns the DELETED status to an Evaluation, rendering it unusable
<code>delete_ml_model</code>	Assigns the DELETED status to an MLModel, rendering it unusable
<code>delete_realtime_endpoint</code>	Deletes a real time endpoint of an MLModel
<code>delete_tags</code>	Deletes the specified tags associated with an ML object
<code>describe_batch_predictions</code>	Returns a list of BatchPrediction operations that match the search criteria in the request
<code>describe_data_sources</code>	Returns a list of DataSource that match the search criteria in the request
<code>describe_evaluations</code>	Returns a list of DescribeEvaluations that match the search criteria in the request
<code>describe_ml_models</code>	Returns a list of MLModel that match the search criteria in the request
<code>describe_tags</code>	Describes one or more of the tags for your Amazon ML object
<code>get_batch_prediction</code>	Returns a BatchPrediction that includes detailed metadata, status, and data file information
<code>get_data_source</code>	Returns a DataSource that includes metadata and data file information, as well as the current status
<code>get_evaluation</code>	Returns an Evaluation that includes metadata as well as the current status of the Evaluation
<code>get_ml_model</code>	Returns an MLModel that includes detailed metadata, data source information, and the current status
<code>predict</code>	Generates a prediction for the observation using the specified ML Model
<code>update_batch_prediction</code>	Updates the BatchPredictionName of a BatchPrediction
<code>update_data_source</code>	Updates the DataSourceName of a DataSource
<code>update_evaluation</code>	Updates the EvaluationName of an Evaluation
<code>update_ml_model</code>	Updates the MLModelName and the ScoreThreshold of an MLModel

## Examples

```
## Not run:
svc <- machinelearning()
svc$add_tags(
  Foo = 123
)

## End(Not run)
```

---

personalize

*Amazon Personalize*

---

## Description

Amazon Personalize is a machine learning service that makes it easy to add individualized recommendations to customers.

**Usage**

```
personalize(config = list())
```

**Arguments**

`config` Optional configuration of credentials, endpoint, and/or region.

**Value**

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

**Service syntax**

```
svc <- personalize(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string"
    ),
    endpoint = "string",
    region = "string"
  )
)
```

**Operations**

<a href="#">create_batch_inference_job</a>	Creates a batch inference job
<a href="#">create_campaign</a>	Creates a campaign by deploying a solution version
<a href="#">create_dataset</a>	Creates an empty dataset and adds it to the specified dataset group
<a href="#">create_dataset_group</a>	Creates an empty dataset group
<a href="#">create_dataset_import_job</a>	Creates a job that imports training data from your data source (an Amazon S3 bucket) to an Amazon Personalize dataset
<a href="#">create_event_tracker</a>	Creates an event tracker that you use when sending event data to the specified dataset group
<a href="#">create_filter</a>	Creates a recommendation filter
<a href="#">create_schema</a>	Creates an Amazon Personalize schema from the specified schema string
<a href="#">create_solution</a>	Creates the configuration for training a model
<a href="#">create_solution_version</a>	Trains or retrains an active solution
<a href="#">delete_campaign</a>	Removes a campaign by deleting the solution deployment
<a href="#">delete_dataset</a>	Deletes a dataset
<a href="#">delete_dataset_group</a>	Deletes a dataset group
<a href="#">delete_event_tracker</a>	Deletes the event tracker
<a href="#">delete_filter</a>	Deletes a filter
<a href="#">delete_schema</a>	Deletes a schema

<code>delete_solution</code>	Deletes all versions of a solution and the Solution object itself
<code>describe_algorithm</code>	Describes the given algorithm
<code>describe_batch_inference_job</code>	Gets the properties of a batch inference job including name, Amazon Resource Name (ARN)
<code>describe_campaign</code>	Describes the given campaign, including its status
<code>describe_dataset</code>	Describes the given dataset
<code>describe_dataset_group</code>	Describes the given dataset group
<code>describe_dataset_import_job</code>	Describes the dataset import job created by <code>CreateDatasetImportJob</code> , including the import job
<code>describe_event_tracker</code>	Describes an event tracker
<code>describe_feature_transformation</code>	Describes the given feature transformation
<code>describe_filter</code>	Describes a filter's properties
<code>describe_recipe</code>	Describes a recipe
<code>describe_schema</code>	Describes a schema
<code>describe_solution</code>	Describes a solution
<code>describe_solution_version</code>	Describes a specific version of a solution
<code>get_solution_metrics</code>	Gets the metrics for the specified solution version
<code>list_batch_inference_jobs</code>	Gets a list of the batch inference jobs that have been performed off of a solution version
<code>list_campaigns</code>	Returns a list of campaigns that use the given solution
<code>list_dataset_groups</code>	Returns a list of dataset groups
<code>list_dataset_import_jobs</code>	Returns a list of dataset import jobs that use the given dataset
<code>list_datasets</code>	Returns the list of datasets contained in the given dataset group
<code>list_event_trackers</code>	Returns the list of event trackers associated with the account
<code>list_filters</code>	Lists all filters that belong to a given dataset group
<code>list_recipes</code>	Returns a list of available recipes
<code>list_schemas</code>	Returns the list of schemas associated with the account
<code>list_solutions</code>	Returns a list of solutions that use the given dataset group
<code>list_solution_versions</code>	Returns a list of solution versions for the given solution
<code>update_campaign</code>	Updates a campaign by either deploying a new solution or changing the value of the campaign

## Examples

```
## Not run:
svc <- personalize()
svc$create_batch_inference_job(
  Foo = 123
)

## End(Not run)
```

---

personalizeevents

*Amazon Personalize Events*

---

## Description

Amazon Personalize can consume real-time user event data, such as *stream* or *click* data, and use it for model training either alone or combined with historical data. For more information see `recording-events`.

**Usage**

```
personalizeevents(config = list())
```

**Arguments**

`config`            Optional configuration of credentials, endpoint, and/or region.

**Value**

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

**Service syntax**

```
svc <- personalizeevents(  
  config = list(  
    credentials = list(  
      creds = list(  
        access_key_id = "string",  
        secret_access_key = "string",  
        session_token = "string"  
      ),  
      profile = "string"  
    ),  
    endpoint = "string",  
    region = "string"  
  )  
)
```

**Operations**

<a href="#">put_events</a>	Records user interaction event data
<a href="#">put_items</a>	Adds one or more items to an Items dataset
<a href="#">put_users</a>	Adds one or more users to a Users dataset

**Examples**

```
## Not run:  
svc <- personalizeevents()  
svc$put_events(  
  Foo = 123  
)  
  
## End(Not run)
```

---

personalizeruntime     *Amazon Personalize Runtime*

---

**Description**

Amazon Personalize Runtime

**Usage**

```
personalizeruntime(config = list())
```

**Arguments**

config            Optional configuration of credentials, endpoint, and/or region.

**Value**

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

**Service syntax**

```
svc <- personalizeruntime(  
  config = list(  
    credentials = list(  
      creds = list(  
        access_key_id = "string",  
        secret_access_key = "string",  
        session_token = "string"  
      ),  
      profile = "string"  
    ),  
    endpoint = "string",  
    region = "string"  
  )  
)
```

**Operations**

<a href="#">get_personalized_ranking</a>	Re-ranks a list of recommended items for the given user
<a href="#">get_recommendations</a>	Returns a list of recommended items

## Examples

```
## Not run:
svc <- personalizeruntime()
svc$get_personalized_ranking(
  Foo = 123
)

## End(Not run)
```

---

polly

*Amazon Polly*

---

## Description

Amazon Polly is a web service that makes it easy to synthesize speech from text.

The Amazon Polly service provides API operations for synthesizing high-quality speech from plain text and Speech Synthesis Markup Language (SSML), along with managing pronunciations lexicons that enable you to get the best results for your application domain.

## Usage

```
polly(config = list())
```

## Arguments

`config` Optional configuration of credentials, endpoint, and/or region.

## Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

## Service syntax

```
svc <- polly(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string"
    ),
    endpoint = "string",
```

```

    region = "string"
  )
)

```

## Operations

<a href="#">delete_lexicon</a>	Deletes the specified pronunciation lexicon stored in an AWS Region
<a href="#">describe_voices</a>	Returns the list of voices that are available for use when requesting speech synthesis
<a href="#">get_lexicon</a>	Returns the content of the specified pronunciation lexicon stored in an AWS Region
<a href="#">get_speech_synthesis_task</a>	Retrieves a specific SpeechSynthesisTask object based on its TaskID
<a href="#">list_lexicons</a>	Returns a list of pronunciation lexicons stored in an AWS Region
<a href="#">list_speech_synthesis_tasks</a>	Returns a list of SpeechSynthesisTask objects ordered by their creation date
<a href="#">put_lexicon</a>	Stores a pronunciation lexicon in an AWS Region
<a href="#">start_speech_synthesis_task</a>	Allows the creation of an asynchronous synthesis task, by starting a new SpeechSynthesisTask
<a href="#">synthesize_speech</a>	Synthesizes UTF-8 input, plain text or SSML, to a stream of bytes

## Examples

```

## Not run:
svc <- polly()
# Deletes a specified pronunciation lexicon stored in an AWS Region.
svc$delete_lexicon(
  Name = "example"
)

## End(Not run)

```

---

rekognition

*Amazon Rekognition*

---

## Description

This is the Amazon Rekognition API reference.

## Usage

```
rekognition(config = list())
```

## Arguments

`config` Optional configuration of credentials, endpoint, and/or region.

**Value**

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

**Service syntax**

```
svc <- rekognition(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string"
    ),
    endpoint = "string",
    region = "string"
  )
)
```

**Operations**

<a href="#">compare_faces</a>	Compares a face in the source input image with each of the 100 largest faces detected in the target image
<a href="#">create_collection</a>	Creates a collection in an AWS Region
<a href="#">create_project</a>	Creates a new Amazon Rekognition Custom Labels project
<a href="#">create_project_version</a>	Creates a new version of a model and begins training
<a href="#">create_stream_processor</a>	Creates an Amazon Rekognition stream processor that you can use to detect and recognize faces in a video stream
<a href="#">delete_collection</a>	Deletes the specified collection
<a href="#">delete_faces</a>	Deletes faces from a collection
<a href="#">delete_project</a>	Deletes an Amazon Rekognition Custom Labels project
<a href="#">delete_project_version</a>	Deletes an Amazon Rekognition Custom Labels model
<a href="#">delete_stream_processor</a>	Deletes the stream processor identified by Name
<a href="#">describe_collection</a>	Describes the specified collection
<a href="#">describe_projects</a>	Lists and gets information about your Amazon Rekognition Custom Labels projects
<a href="#">describe_project_versions</a>	Lists and describes the models in an Amazon Rekognition Custom Labels project
<a href="#">describe_stream_processor</a>	Provides information about a stream processor created by CreateStreamProcessor
<a href="#">detect_custom_labels</a>	Detects custom labels in a supplied image by using an Amazon Rekognition Custom Labels model
<a href="#">detect_faces</a>	Detects faces within an image that is provided as input
<a href="#">detect_labels</a>	Detects instances of real-world entities within an image (JPEG or PNG) provided as input
<a href="#">detect_moderation_labels</a>	Detects unsafe content in a specified JPEG or PNG format image
<a href="#">detect_protective_equipment</a>	Detects Personal Protective Equipment (PPE) worn by people detected in an image
<a href="#">detect_text</a>	Detects text in the input image and converts it into machine-readable text
<a href="#">get_celebrity_info</a>	Gets the name and additional information about a celebrity based on his or her Amazon Rekognition Video analysis
<a href="#">get_celebrity_recognition</a>	Gets the celebrity recognition results for a Amazon Rekognition Video analysis started by StartFaceDetection
<a href="#">get_content_moderation</a>	Gets the unsafe content analysis results for a Amazon Rekognition Video analysis started by StartFaceDetection
<a href="#">get_face_detection</a>	Gets face detection results for a Amazon Rekognition Video analysis started by StartFaceDetection

<a href="#">get_face_search</a>	Gets the face search results for Amazon Rekognition Video face search started by StartFaceSearch
<a href="#">get_label_detection</a>	Gets the label detection results of a Amazon Rekognition Video analysis started by StartLabelDetection
<a href="#">get_person_tracking</a>	Gets the path tracking results of a Amazon Rekognition Video analysis started by StartPersonTracking
<a href="#">get_segment_detection</a>	Gets the segment detection results of a Amazon Rekognition Video analysis started by StartSegmentDetection
<a href="#">get_text_detection</a>	Gets the text detection results of a Amazon Rekognition Video analysis started by StartTextDetection
<a href="#">index_faces</a>	Detects faces in the input image and adds them to the specified collection
<a href="#">list_collections</a>	Returns list of collection IDs in your account
<a href="#">list_faces</a>	Returns metadata for faces in the specified collection
<a href="#">list_stream_processors</a>	Gets a list of stream processors that you have created with CreateStreamProcessor
<a href="#">recognize_celebrities</a>	Returns an array of celebrities recognized in the input image
<a href="#">search_faces</a>	For a given input face ID, searches for matching faces in the collection the face belongs to
<a href="#">search_faces_by_image</a>	For a given input image, first detects the largest face in the image, and then searches the specified collection for matching faces
<a href="#">start_celebrity_recognition</a>	Starts asynchronous recognition of celebrities in a stored video
<a href="#">start_content_moderation</a>	Starts asynchronous detection of unsafe content in a stored video
<a href="#">start_face_detection</a>	Starts asynchronous detection of faces in a stored video
<a href="#">start_face_search</a>	Starts the asynchronous search for faces in a collection that match the faces of persons detected in the source image
<a href="#">start_label_detection</a>	Starts asynchronous detection of labels in a stored video
<a href="#">start_person_tracking</a>	Starts the asynchronous tracking of a person's path in a stored video
<a href="#">start_project_version</a>	Starts the running of the version of a model
<a href="#">start_segment_detection</a>	Starts asynchronous detection of segment detection in a stored video
<a href="#">start_stream_processor</a>	Starts processing a stream processor
<a href="#">start_text_detection</a>	Starts asynchronous detection of text in a stored video
<a href="#">stop_project_version</a>	Stops a running model
<a href="#">stop_stream_processor</a>	Stops a running stream processor that was created by CreateStreamProcessor

## Examples

```
## Not run:
svc <- rekognition()
# This operation compares the largest face detected in the source image
# with each face detected in the target image.
svc$compare_faces(
  SimilarityThreshold = 90L,
  SourceImage = list(
    S3Object = list(
      Bucket = "mybucket",
      Name = "mysourceimage"
    )
  ),
  TargetImage = list(
    S3Object = list(
      Bucket = "mybucket",
      Name = "mytargetimage"
    )
  )
)
## End(Not run)
```

---

sagemaker

*Amazon SageMaker Service*

---

### Description

Provides APIs for creating and managing Amazon SageMaker resources.

Other Resources:

- [Amazon SageMaker Developer Guide](#)
- [Amazon Augmented AI Runtime API Reference](#)

### Usage

```
sagemaker(config = list())
```

### Arguments

`config`            Optional configuration of credentials, endpoint, and/or region.

### Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

### Service syntax

```
svc <- sagemaker(  
  config = list(  
    credentials = list(  
      creds = list(  
        access_key_id = "string",  
        secret_access_key = "string",  
        session_token = "string"  
      ),  
      profile = "string"  
    ),  
    endpoint = "string",  
    region = "string"  
  )  
)
```

**Operations**

<code>add_association</code>	Creates an association between the source and the destination
<code>add_tags</code>	Adds or overwrites one or more tags for the specified Amazon SageMaker resource
<code>associate_trial_component</code>	Associates a trial component with a trial
<code>create_action</code>	Creates an action
<code>create_algorithm</code>	Create a machine learning algorithm that you can use in Amazon SageMaker
<code>create_app</code>	Creates a running App for the specified UserProfile
<code>create_app_image_config</code>	Creates a configuration for running a SageMaker image as a KernelGateway
<code>create_artifact</code>	Creates an artifact
<code>create_auto_ml_job</code>	Creates an Autopilot job
<code>create_code_repository</code>	Creates a Git repository as a resource in your Amazon SageMaker account
<code>create_compilation_job</code>	Starts a model compilation job
<code>create_context</code>	Creates a context
<code>create_data_quality_job_definition</code>	Creates a definition for a job that monitors data quality and drift
<code>create_device_fleet</code>	Creates a device fleet
<code>create_domain</code>	Creates a Domain used by Amazon SageMaker Studio
<code>create_edge_packaging_job</code>	Starts a SageMaker Edge Manager model packaging job
<code>create_endpoint</code>	Creates an endpoint using the endpoint configuration specified in the request
<code>create_endpoint_config</code>	Creates an endpoint configuration that Amazon SageMaker hosting service uses to serve traffic
<code>create_experiment</code>	Creates an SageMaker experiment
<code>create_feature_group</code>	Create a new FeatureGroup
<code>create_flow_definition</code>	Creates a flow definition
<code>create_human_task_ui</code>	Defines the settings you will use for the human review workflow user interface
<code>create_hyper_parameter_tuning_job</code>	Starts a hyperparameter tuning job
<code>create_image</code>	Creates a custom SageMaker image
<code>create_image_version</code>	Creates a version of the SageMaker image specified by ImageName
<code>create_labeling_job</code>	Creates a job that uses workers to label the data objects in your input data
<code>create_model</code>	Creates a model in Amazon SageMaker
<code>create_model_bias_job_definition</code>	Creates the definition for a model bias job
<code>create_model_explainability_job_definition</code>	Creates the definition for a model explainability job
<code>create_model_package</code>	Creates a model package that you can use to create Amazon SageMaker endpoints
<code>create_model_package_group</code>	Creates a model group
<code>create_model_quality_job_definition</code>	Creates a definition for a job that monitors model quality and drift
<code>create_monitoring_schedule</code>	Creates a schedule that regularly starts Amazon SageMaker Processing Jobs
<code>create_notebook_instance</code>	Creates an Amazon SageMaker notebook instance
<code>create_notebook_instance_lifecycle_config</code>	Creates a lifecycle configuration that you can associate with a notebook instance
<code>create_pipeline</code>	Creates a pipeline using a JSON pipeline definition
<code>create_presigned_domain_url</code>	Creates a URL for a specified UserProfile in a Domain
<code>create_presigned_notebook_instance_url</code>	Returns a URL that you can use to connect to the Jupyter server from a notebook instance
<code>create_processing_job</code>	Creates a processing job
<code>create_project</code>	Creates a machine learning (ML) project that can contain one or more trials
<code>create_training_job</code>	Starts a model training job
<code>create_transform_job</code>	Starts a transform job
<code>create_trial</code>	Creates an Amazon SageMaker trial
<code>create_trial_component</code>	Creates a trial component, which is a stage of a machine learning trial
<code>create_user_profile</code>	Creates a user profile
<code>create_workforce</code>	Use this operation to create a workforce

<code>create_workteam</code>	Creates a new work team for labeling your data
<code>delete_action</code>	Deletes an action
<code>delete_algorithm</code>	Removes the specified algorithm from your account
<code>delete_app</code>	Used to stop and delete an app
<code>delete_app_image_config</code>	Deletes an AppImageConfig
<code>delete_artifact</code>	Deletes an artifact
<code>delete_association</code>	Deletes an association
<code>delete_code_repository</code>	Deletes the specified Git repository from your account
<code>delete_context</code>	Deletes an context
<code>delete_data_quality_job_definition</code>	Deletes a data quality monitoring job definition
<code>delete_device_fleet</code>	Deletes a fleet
<code>delete_domain</code>	Used to delete a domain
<code>delete_endpoint</code>	Deletes an endpoint
<code>delete_endpoint_config</code>	Deletes an endpoint configuration
<code>delete_experiment</code>	Deletes an Amazon SageMaker experiment
<code>delete_feature_group</code>	Delete the FeatureGroup and any data that was written to the OnlineStore
<code>delete_flow_definition</code>	Deletes the specified flow definition
<code>delete_human_task_ui</code>	Use this operation to delete a human task user interface (worker task ter
<code>delete_image</code>	Deletes a SageMaker image and all versions of the image
<code>delete_image_version</code>	Deletes a version of a SageMaker image
<code>delete_model</code>	Deletes a model
<code>delete_model_bias_job_definition</code>	Deletes an Amazon SageMaker model bias job definition
<code>delete_model_explainability_job_definition</code>	Deletes an Amazon SageMaker model explainability job definition
<code>delete_model_package</code>	Deletes a model package
<code>delete_model_package_group</code>	Deletes the specified model group
<code>delete_model_package_group_policy</code>	Deletes a model group resource policy
<code>delete_model_quality_job_definition</code>	Deletes the specified model quality monitoring job definition
<code>delete_monitoring_schedule</code>	Deletes a monitoring schedule
<code>delete_notebook_instance</code>	Deletes an Amazon SageMaker notebook instance
<code>delete_notebook_instance_lifecycle_config</code>	Deletes a notebook instance lifecycle configuration
<code>delete_pipeline</code>	Deletes a pipeline if there are no in-progress executions
<code>delete_project</code>	Delete the specified project
<code>delete_tags</code>	Deletes the specified tags from an Amazon SageMaker resource
<code>delete_trial</code>	Deletes the specified trial
<code>delete_trial_component</code>	Deletes the specified trial component
<code>delete_user_profile</code>	Deletes a user profile
<code>delete_workforce</code>	Use this operation to delete a workforce
<code>delete_workteam</code>	Deletes an existing work team
<code>deregister_devices</code>	Deregisters the specified devices
<code>describe_action</code>	Describes an action
<code>describe_algorithm</code>	Returns a description of the specified algorithm that is in your account
<code>describe_app</code>	Describes the app
<code>describe_app_image_config</code>	Describes an AppImageConfig
<code>describe_artifact</code>	Describes an artifact
<code>describe_auto_ml_job</code>	Returns information about an Amazon SageMaker job
<code>describe_code_repository</code>	Gets details about the specified Git repository
<code>describe_compilation_job</code>	Returns information about a model compilation job
<code>describe_context</code>	Describes a context

<code>describe_data_quality_job_definition</code>	Gets the details of a data quality monitoring job definition
<code>describe_device</code>	Describes the device
<code>describe_device_fleet</code>	A description of the fleet the device belongs to
<code>describe_domain</code>	The description of the domain
<code>describe_edge_packaging_job</code>	A description of edge packaging jobs
<code>describe_endpoint</code>	Returns the description of an endpoint
<code>describe_endpoint_config</code>	Returns the description of an endpoint configuration created using the C
<code>describe_experiment</code>	Provides a list of an experiment's properties
<code>describe_feature_group</code>	Use this operation to describe a FeatureGroup
<code>describe_flow_definition</code>	Returns information about the specified flow definition
<code>describe_human_task_ui</code>	Returns information about the requested human task user interface (wor
<code>describe_hyper_parameter_tuning_job</code>	Gets a description of a hyperparameter tuning job
<code>describe_image</code>	Describes a SageMaker image
<code>describe_image_version</code>	Describes a version of a SageMaker image
<code>describe_labeling_job</code>	Gets information about a labeling job
<code>describe_model</code>	Describes a model that you created using the CreateModel API
<code>describe_model_bias_job_definition</code>	Returns a description of a model bias job definition
<code>describe_model_explainability_job_definition</code>	Returns a description of a model explainability job definition
<code>describe_model_package</code>	Returns a description of the specified model package, which is used to c
<code>describe_model_package_group</code>	Gets a description for the specified model group
<code>describe_model_quality_job_definition</code>	Returns a description of a model quality job definition
<code>describe_monitoring_schedule</code>	Describes the schedule for a monitoring job
<code>describe_notebook_instance</code>	Returns information about a notebook instance
<code>describe_notebook_instance_lifecycle_config</code>	Returns a description of a notebook instance lifecycle configuration
<code>describe_pipeline</code>	Describes the details of a pipeline
<code>describe_pipeline_definition_for_execution</code>	Describes the details of an execution's pipeline definition
<code>describe_pipeline_execution</code>	Describes the details of a pipeline execution
<code>describe_processing_job</code>	Returns a description of a processing job
<code>describe_project</code>	Describes the details of a project
<code>describe_subscribed_workteam</code>	Gets information about a work team provided by a vendor
<code>describe_training_job</code>	Returns information about a training job
<code>describe_transform_job</code>	Returns information about a transform job
<code>describe_trial</code>	Provides a list of a trial's properties
<code>describe_trial_component</code>	Provides a list of a trials component's properties
<code>describe_user_profile</code>	Describes a user profile
<code>describe_workforce</code>	Lists private workforce information, including workforce name, Amazon
<code>describe_workteam</code>	Gets information about a specific work team
<code>disable_sagemaker_servicecatalog_portfolio</code>	Disables using Service Catalog in SageMaker
<code>disassociate_trial_component</code>	Disassociates a trial component from a trial
<code>enable_sagemaker_servicecatalog_portfolio</code>	Enables using Service Catalog in SageMaker
<code>get_device_fleet_report</code>	Describes a fleet
<code>get_model_package_group_policy</code>	Gets a resource policy that manages access for a model group
<code>get_sagemaker_servicecatalog_portfolio_status</code>	Gets the status of Service Catalog in SageMaker
<code>get_search_suggestions</code>	An auto-complete API for the search functionality in the Amazon Sage
<code>list_actions</code>	Lists the actions in your account and their properties
<code>list_algorithms</code>	Lists the machine learning algorithms that have been created
<code>list_app_image_configs</code>	Lists the AppImageConfigs in your account and their properties
<code>list_apps</code>	Lists apps

<code>list_artifacts</code>	Lists the artifacts in your account and their properties
<code>list_associations</code>	Lists the associations in your account and their properties
<code>list_auto_ml_jobs</code>	Request a list of jobs
<code>list_candidates_for_auto_ml_job</code>	List the Candidates created for the job
<code>list_code_repositories</code>	Gets a list of the Git repositories in your account
<code>list_compilation_jobs</code>	Lists model compilation jobs that satisfy various filters
<code>list_contexts</code>	Lists the contexts in your account and their properties
<code>list_data_quality_job_definitions</code>	Lists the data quality job definitions in your account
<code>list_device_fleets</code>	Returns a list of devices in the fleet
<code>list_devices</code>	A list of devices
<code>list_domains</code>	Lists the domains
<code>list_edge_packaging_jobs</code>	Returns a list of edge packaging jobs
<code>list_endpoint_configs</code>	Lists endpoint configurations
<code>list_endpoints</code>	Lists endpoints
<code>list_experiments</code>	Lists all the experiments in your account
<code>list_feature_groups</code>	List FeatureGroups based on given filter and order
<code>list_flow_definitions</code>	Returns information about the flow definitions in your account
<code>list_human_task_uis</code>	Returns information about the human task user interfaces in your account
<code>list_hyper_parameter_tuning_jobs</code>	Gets a list of HyperParameterTuningJobSummary objects that describe the jobs
<code>list_images</code>	Lists the images in your account and their properties
<code>list_image_versions</code>	Lists the versions of a specified image and their properties
<code>list_labeling_jobs</code>	Gets a list of labeling jobs
<code>list_labeling_jobs_for_workteam</code>	Gets a list of labeling jobs assigned to a specified work team
<code>list_model_bias_job_definitions</code>	Lists model bias jobs definitions that satisfy various filters
<code>list_model_explainability_job_definitions</code>	Lists model explainability job definitions that satisfy various filters
<code>list_model_package_groups</code>	Gets a list of the model groups in your AWS account
<code>list_model_packages</code>	Lists the model packages that have been created
<code>list_model_quality_job_definitions</code>	Gets a list of model quality monitoring job definitions in your account
<code>list_models</code>	Lists models created with the CreateModel API
<code>list_monitoring_executions</code>	Returns list of all monitoring job executions
<code>list_monitoring_schedules</code>	Returns list of all monitoring schedules
<code>list_notebook_instance_lifecycle_configs</code>	Lists notebook instance lifecycle configurations created with the CreateNotebookInstanceLifecycleConfig API
<code>list_notebook_instances</code>	Returns a list of the Amazon SageMaker notebook instances in the requested region
<code>list_pipeline_executions</code>	Gets a list of the pipeline executions
<code>list_pipeline_execution_steps</code>	Gets a list of PipeLineExecutionStep objects
<code>list_pipeline_parameters_for_execution</code>	Gets a list of parameters for a pipeline execution
<code>list_pipelines</code>	Gets a list of pipelines
<code>list_processing_jobs</code>	Lists processing jobs that satisfy various filters
<code>list_projects</code>	Gets a list of the projects in an AWS account
<code>list_subscribed_workteams</code>	Gets a list of the work teams that you are subscribed to in the AWS Marketplace
<code>list_tags</code>	Returns the tags for the specified Amazon SageMaker resource
<code>list_training_jobs</code>	Lists training jobs
<code>list_training_jobs_for_hyper_parameter_tuning_job</code>	Gets a list of TrainingJobSummary objects that describe the training jobs
<code>list_transform_jobs</code>	Lists transform jobs
<code>list_trial_components</code>	Lists the trial components in your account
<code>list_trials</code>	Lists the trials in your account
<code>list_user_profiles</code>	Lists user profiles
<code>list_workforces</code>	Use this operation to list all private and vendor workforces in an AWS account

<code>list_workteams</code>	Gets a list of private work teams that you have defined in a region
<code>put_model_package_group_policy</code>	Adds a resource policy to control access to a model group
<code>register_devices</code>	Register devices
<code>render_ui_template</code>	Renders the UI template so that you can preview the worker's experience
<code>search</code>	Finds Amazon SageMaker resources that match a search query
<code>start_monitoring_schedule</code>	Starts a previously stopped monitoring schedule
<code>start_notebook_instance</code>	Launches an ML compute instance with the latest version of the libraries
<code>start_pipeline_execution</code>	Starts a pipeline execution
<code>stop_auto_ml_job</code>	A method for forcing the termination of a running job
<code>stop_compilation_job</code>	Stops a model compilation job
<code>stop_edge_packaging_job</code>	Request to stop an edge packaging job
<code>stop_hyper_parameter_tuning_job</code>	Stops a running hyperparameter tuning job and all running training jobs
<code>stop_labeling_job</code>	Stops a running labeling job
<code>stop_monitoring_schedule</code>	Stops a previously started monitoring schedule
<code>stop_notebook_instance</code>	Terminates the ML compute instance
<code>stop_pipeline_execution</code>	Stops a pipeline execution
<code>stop_processing_job</code>	Stops a processing job
<code>stop_training_job</code>	Stops a training job
<code>stop_transform_job</code>	Stops a transform job
<code>update_action</code>	Updates an action
<code>update_app_image_config</code>	Updates the properties of an AppImageConfig
<code>update_artifact</code>	Updates an artifact
<code>update_code_repository</code>	Updates the specified Git repository with the specified values
<code>update_context</code>	Updates a context
<code>update_device_fleet</code>	Updates a fleet of devices
<code>update_devices</code>	Updates one or more devices in a fleet
<code>update_domain</code>	Updates the default settings for new user profiles in the domain
<code>update_endpoint</code>	Deploys the new EndpointConfig specified in the request, switches to u
<code>update_endpoint_weights_and_capacities</code>	Updates variant weight of one or more variants associated with an exist
<code>update_experiment</code>	Adds, updates, or removes the description of an experiment
<code>update_image</code>	Updates the properties of a SageMaker image
<code>update_model_package</code>	Updates a versioned model
<code>update_monitoring_schedule</code>	Updates a previously created schedule
<code>update_notebook_instance</code>	Updates a notebook instance
<code>update_notebook_instance_lifecycle_config</code>	Updates a notebook instance lifecycle configuration created with the Cr
<code>update_pipeline</code>	Updates a pipeline
<code>update_pipeline_execution</code>	Updates a pipeline execution
<code>update_training_job</code>	Update a model training job to request a new Debugger profiling config
<code>update_trial</code>	Updates the display name of a trial
<code>update_trial_component</code>	Updates one or more properties of a trial component
<code>update_user_profile</code>	Updates a user profile
<code>update_workforce</code>	Use this operation to update your workforce
<code>update_workteam</code>	Updates an existing work team with new member definitions or descrip

## Examples

```

---

sagemakerruntime      *Amazon SageMaker Runtime*

---

## Description

The Amazon SageMaker runtime API.

## Usage

```
sagemakerruntime(config = list())
```

## Arguments

`config`              Optional configuration of credentials, endpoint, and/or region.

## Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

## Service syntax

```
svc <- sagemakerruntime(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string"
    ),
    endpoint = "string",
    region = "string"
  )
)
```

## Operations

`invoke_endpoint` After you deploy a model into production using Amazon SageMaker hosting services, your client application

## Examples

```
## Not run:
svc <- sagemakerruntime()
svc$invoke_endpoint(
  Foo = 123
)

## End(Not run)
```

---

textract

*Amazon Textract*

---

## Description

Amazon Textract detects and analyzes text in documents and converts it into machine-readable text. This is the API reference documentation for Amazon Textract.

## Usage

```
textract(config = list())
```

## Arguments

`config` Optional configuration of credentials, endpoint, and/or region.

## Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

## Service syntax

```
svc <- textract(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string"
```

```

    ),
    endpoint = "string",
    region = "string"
  )
)

```

## Operations

<a href="#">analyze_document</a>	Analyzes an input document for relationships between detected items
<a href="#">detect_document_text</a>	Detects text in the input document
<a href="#">get_document_analysis</a>	Gets the results for an Amazon Textract asynchronous operation that analyzes text in a document
<a href="#">get_document_text_detection</a>	Gets the results for an Amazon Textract asynchronous operation that detects text in a document
<a href="#">start_document_analysis</a>	Starts the asynchronous analysis of an input document for relationships between detected items
<a href="#">start_document_text_detection</a>	Starts the asynchronous detection of text in a document

## Examples

```

## Not run:
svc <- textract()
svc$analyze_document(
  Foo = 123
)

## End(Not run)

```

---

transcribeservice      *Amazon Transcribe Service*

---

## Description

Operations and objects for transcribing speech to text.

## Usage

```
transcribeservice(config = list())
```

## Arguments

`config`            Optional configuration of credentials, endpoint, and/or region.

## Value

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

**Service syntax**

```

svc <- transcribeservice(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string"
    ),
    endpoint = "string",
    region = "string"
  )
)

```

**Operations**

<a href="#">create_language_model</a>	Creates a new custom language model
<a href="#">create_medical_vocabulary</a>	Creates a new custom vocabulary that you can use to change how Amazon Transcribe Medical
<a href="#">create_vocabulary</a>	Creates a new custom vocabulary that you can use to change the way Amazon Transcribe
<a href="#">create_vocabulary_filter</a>	Creates a new vocabulary filter that you can use to filter words, such as profane words, fro
<a href="#">delete_language_model</a>	Deletes a custom language model using its name
<a href="#">delete_medical_transcription_job</a>	Deletes a transcription job generated by Amazon Transcribe Medical and any related info
<a href="#">delete_medical_vocabulary</a>	Deletes a vocabulary from Amazon Transcribe Medical
<a href="#">delete_transcription_job</a>	Deletes a previously submitted transcription job along with any other generated results su
<a href="#">delete_vocabulary</a>	Deletes a vocabulary from Amazon Transcribe
<a href="#">delete_vocabulary_filter</a>	Removes a vocabulary filter
<a href="#">describe_language_model</a>	Gets information about a single custom language model
<a href="#">get_medical_transcription_job</a>	Returns information about a transcription job from Amazon Transcribe Medical
<a href="#">get_medical_vocabulary</a>	Retrieves information about a medical vocabulary
<a href="#">get_transcription_job</a>	Returns information about a transcription job
<a href="#">get_vocabulary</a>	Gets information about a vocabulary
<a href="#">get_vocabulary_filter</a>	Returns information about a vocabulary filter
<a href="#">list_language_models</a>	Provides more information about the custom language models you've created
<a href="#">list_medical_transcription_jobs</a>	Lists medical transcription jobs with a specified status or substring that matches their nam
<a href="#">list_medical_vocabularies</a>	Returns a list of vocabularies that match the specified criteria
<a href="#">list_transcription_jobs</a>	Lists transcription jobs with the specified status
<a href="#">list_vocabularies</a>	Returns a list of vocabularies that match the specified criteria
<a href="#">list_vocabulary_filters</a>	Gets information about vocabulary filters
<a href="#">start_medical_transcription_job</a>	Starts a batch job to transcribe medical speech to text
<a href="#">start_transcription_job</a>	Starts an asynchronous job to transcribe speech to text
<a href="#">update_medical_vocabulary</a>	Updates a vocabulary with new values that you provide in a different text file from the one
<a href="#">update_vocabulary</a>	Updates an existing vocabulary with new values
<a href="#">update_vocabulary_filter</a>	Updates a vocabulary filter with a new list of filtered words

**Examples**

```
## Not run:
svc <- transcribeservice()
svc$create_language_model(
  Foo = 123
)

## End(Not run)
```

---

translate

*Amazon Translate*

---

**Description**

Provides translation between one source language and another of the same set of languages.

**Usage**

```
translate(config = list())
```

**Arguments**

`config` Optional configuration of credentials, endpoint, and/or region.

**Value**

A client for the service. You can call the service's operations using syntax like `svc$operation(...)`, where `svc` is the name you've assigned to the client. The available operations are listed in the Operations section.

**Service syntax**

```
svc <- translate(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string"
    ),
    endpoint = "string",
    region = "string"
  )
)
```

**Operations**

<a href="#">create_parallel_data</a>	Creates a parallel data resource in Amazon Translate by importing an input file from Amazon
<a href="#">delete_parallel_data</a>	Deletes a parallel data resource in Amazon Translate
<a href="#">delete_terminology</a>	A synchronous action that deletes a custom terminology
<a href="#">describe_text_translation_job</a>	Gets the properties associated with an asynchronous batch translation job including name, ID,
<a href="#">get_parallel_data</a>	Provides information about a parallel data resource
<a href="#">get_terminology</a>	Retrieves a custom terminology
<a href="#">import_terminology</a>	Creates or updates a custom terminology, depending on whether or not one already exists for t
<a href="#">list_parallel_data</a>	Provides a list of your parallel data resources in Amazon Translate
<a href="#">list_terminologies</a>	Provides a list of custom terminologies associated with your account
<a href="#">list_text_translation_jobs</a>	Gets a list of the batch translation jobs that you have submitted
<a href="#">start_text_translation_job</a>	Starts an asynchronous batch translation job
<a href="#">stop_text_translation_job</a>	Stops an asynchronous batch translation job that is in progress
<a href="#">translate_text</a>	Translates input text from the source language to the target language
<a href="#">update_parallel_data</a>	Updates a previously created parallel data resource by importing a new input file from Amazon

## Examples

```
## Not run:
svc <- translate()
svc$create_parallel_data(
  Foo = 123
)

## End(Not run)
```
