Type Package

Title Bootstrap Imputation for Single-Cell RNA-Seq Data

Version 1.0.3

Date 2020-07-15

Author Sam Tracy & Ruben Dries

Maintainer Sam Tracy <seasamgo@gmail.com>

Description Given a log-transformed expression matrix and list of informative genes: subsample informative genes, cluster samples using shared nearest neighbors clustering, estimate missing expression values with the distribution mean of means extrapolated from these cell clusterings, and return an imputed expression matrix. See Tracy, S., Yuan, G.C. and Dries, R. (2019) <doi:10.1186/s12859-019-2977-0> for more details.

R topics documented:

`bootstrapImputation` *Bootstrap Imputation*

Description

Subsample informative genes, cluster cells using SNN, estimate missing expression values with the distribution mean of means extrapolated from these cell clusterings

Usage

```
bootstrapImputation(
  expression_matrix,
  select_cells = NULL,
  select_genes = NULL,
  log_transformed = TRUE,
  log_base = exp(1),
  proportion_genes = 0.6,
  bootstrap_samples = 100,
  number_pcs = 8,
  k_neighbors = 30,
  snn_resolution = 0.9,
  impute_index = NULL,
  use_mclapply = FALSE,
  cores = 2,
  return_individual_results = FALSE,
  python_path = NULL,
  verbose = FALSE
)
```

Arguments

`expression_matrix`	Row by column log-normalized expression matrix
`select_cells`	Subset cells if desired
`select_genes`	A vector of highly variable of differentially expressed gene names, defaults to the most variable
`log_transformed`	Whether the expression matrix has been log-transformed

log_base	If log-transformed, log-base used
proportion_genes	Proportion of informative genes to sample
bootstrap_samples	Number of samples for the bootstrap
number_pcs	Number of dimensions to inform SNN clustering
k_neighbors	Number of k neighbors to use for NN network
snn_resolution	Resolution parameter for SNN
impute_index	Index to impute, will default to all zeroes
use_mclapply	Run in parallel, default FALSE
cores	Number of cores for parallelization
return_individual_results	Return a list of subsampled means
python_path	path to your python binary (default = system path)
verbose	Print progress output to the console

Value

Returns a list with the imputed and original expression matrices

Examples

```
set.seed(0)
requireNamespace("Matrix")

## generate (meaningless) counts
c1 <- stats::rpois(5e3, 1)
c2 <- stats::rpois(5e3, 2)
m <- t(
  rbind(
    matrix(c1, nrow = 20),
    matrix(c2, nrow = 20)
  )
)

## construct an expression matrix m
colnames(m) <- paste0('cell', 1:ncol(m))
rownames(m) <- paste0('gene', 1:nrow(m))
m <- log(m/colSums(m)*1e4 + 1)
m <- methods::as(m, 'dgCMatrix')

## impute

m_imputed <- rescue::bootstrapImputation(
  expression_matrix = m,
  proportion_genes = .9,
  bootstrap_samples = 2,
  k_neighbors = 10
```

```
)
```

`clusterLouvain` *Cluster Cells via Louvain Algorithm*

Description

Cluster cells using a NN-network and the Louvain algorithm from the community module in Python

Usage

```
clusterLouvain(
  nn_network,
  python_path = NULL,
  resolution = 1,
  weight_col = NULL,
  louv_random = F,
  set_seed = T,
  seed_number = 0,
  ...
)
```

Arguments

`nn_network`	Constructed nearest neighbor network to use
`python_path`	Specify specific path to python if required
`resolution`	Resolution
`weight_col`	Weight column
`louv_random`	Random
`set_seed`	Set seed
`seed_number`	Number for seed
`...`	Additional parameters

Value

A character vector of cluster labels

computeHVG *Compute Highly Variable Genes*

Description

Compute Highly Variable Genes

Usage

```
computeHVG(
  expression_matrix,
  reverse_log_scale = T,
  log_base = exp(1),
  expression_threshold = 0,
  nr_expression_groups = 20,
  zscore_threshold = 1.5
)
```

Arguments

expression_matrix	Expression matrix
reverse_log_scale	Reverse log-scale of expression values
log_base	If reverse_log_scale is TRUE, which log base was used?
expression_threshold	Expression threshold to consider a gene detected
nr_expression_groups	Number of expression groups for cov_groups
zscore_threshold	Z-score to select hvg for cov_groups

Value

Character vector of highly variable genes

Examples

```
set.seed(0)
requireNamespace("Matrix")

## generate (meaningless) counts
c1 <- stats::rpois(5e3, 1)
c2 <- stats::rpois(5e3, 2)
m <- t(
  rbind(
    matrix(c1, nrow = 20),
```

```
    matrix(c2, nrow = 20)
  )
)

## construct an expression matrix m
colnames(m) <- paste0('cell', 1:ncol(m))
rownames(m) <- paste0('gene', 1:nrow(m))
m <- log(m/colSums(m)*1e4 + 1)
m <- methods::as(m, 'dgCMatrix')

## calculate HVGs
hvgs <- computeHVG(m)
```

`constructNN` *Nearest Network*

Description

Construct a nearest neighbour network based on previously computed PCs

Usage

```
constructNN(
  reduced_object,
  k_neighbors = 30,
  minimum_shared = 5,
  top_shared = 3,
  verbose = F,
  ...
)
```

Arguments

`reduced_object`	PC reduction matrix
`k_neighbors`	Number of k neighbors to use
`minimum_shared`	Minimum shared neighbors
`top_shared`	Keep at ...
`verbose`	Be verbose
`...`	Additional parameters

Value

NN network as igraph object

`sampleImputation` *Sample-mean Estimation*

Description

Cluster cells using SNN and a list of given genes, estimate missing expression values for each cell-gene combination with the within-cluster non-zero expression mean

Usage

```
sampleImputation(
  expression_matrix,
  subset_genes = NULL,
  scale_data = TRUE,
  number_pcs = 8,
  k_neighbors = 30,
  snn_resolution = 0.9,
  impute_index = NULL,
  pseudo_zero = NULL,
  python_path = NULL,
  verbose = FALSE
)
```

Arguments

`expression_matrix`	Row by column log-normalized expression matrix
`subset_genes`	A vector of informative gene names, defaults to all genes
`scale_data`	Whether to standardize expression by gene, default TRUE
`number_pcs`	Number of dimensions to inform SNN clustering
`k_neighbors`	Number of k neighbors to use for NN network
`snn_resolution`	Resolution parameter for SNN
`impute_index`	Index to impute, will default to all zeroes
`pseudo_zero`	Pseudo-zero expression value
`python_path`	path to your python binary (default = system path)
`verbose`	Print progress output to the console

Value

Returns a sparse matrix of class 'dgCMatrix'

Examples

```
set.seed(0)
requireNamespace("Matrix")

## generate (meaningless) counts
c1 <- stats::rpois(5e3, 1)
c2 <- stats::rpois(5e3, 2)
m <- t(
  rbind(
    matrix(c1, nrow = 20),
    matrix(c2, nrow = 20)
  )
)

## construct an expression matrix m
colnames(m) <- paste0('cell', 1:ncol(m))
rownames(m) <- paste0('gene', 1:nrow(m))
m <- log(m/colSums(m)*1e4 + 1)
m <- methods::as(m, 'dgCMatrix')

## impute

m_imputed <- rescue::sampleImputation(
  expression_matrix = m,
  k_neighbors = 10
)
```
