

# Package ‘tactile’

October 14, 2022

**Title** New and Extended Plots, Methods, and Panel Functions for  
'lattice'

**Version** 0.2.0

**Description** Extensions to 'lattice', providing new high-level  
functions, methods for existing functions, panel functions, and a theme.

**Depends** R (>= 3.4.0), lattice

**Imports** grDevices, grid, gridExtra, latticeExtra, MASS, RColorBrewer,  
stats, utils

**Suggests** covr, forecast, knitr, rmarkdown, testthat, zoo

**License** GPL-3

**Encoding** UTF-8

**LazyData** true

**RoxygenNote** 6.0.1

**URL** <https://github.com/jolars/tactile>

**BugReports** <https://github.com/jolars/tactile/issues>

**VignetteBuilder** knitr

**NeedsCompilation** no

**Author** Johan Larsson [aut, cre] (<<https://orcid.org/0000-0002-4029-5945>>),  
Deepayan Sarkar [ctb, cph] (lattice),  
Brian Ripley [ctb] (stats::plot.acf)

**Maintainer** Johan Larsson <[johanlarsson@outlook.com](mailto:johanlarsson@outlook.com)>

**Repository** CRAN

**Date/Publication** 2018-04-23 16:45:09 UTC

bubbleplot	<i>Bubbleplots</i>
------------	--------------------

---

## Description

Draws bubbleblots – trivariate plots where the third dimension is mapped to the size of the points drawn on the screen.

## Usage

```
bubbleplot(x, data = NULL, ...)

## S3 method for class 'formula'
bubbleplot(x, data = NULL, maxsize = 3,
  bubblekey = TRUE, panel = panel.bubbleplot, groups = NULL,
  subset = TRUE,
  drop.unused.levels = lattice.getOption("drop.unused.levels"), ..., outer,
  allow.multiple)
```

## Arguments

x	A formula of the form $z \sim x * y$ , where x and y have the usual interpretation in trellis graphics (see <code>lattice::xyplot()</code> ) and z is mapped to the size of bubbles.
data	A data.frame, list or environment wherein the formula and groups arguments can be evaluated.

...	Further arguments to pass to <code>lattice::xyplot()</code> .
maxsize	Maximum size (in cex) for the bubbles.
bubblekey	Set to TRUE to draw an informative legend about the bubbles. Uses <code>lattice::draw.key()</code> . See the <b>key</b> section of the documentation in <code>lattice::xyplot()</code> . If both <code>auto.key</code> and <code>bubblekey</code> are given and their space arguments (positions) conflict, <code>bubblekey</code> will silently override the position of <code>auto.key</code> .
panel	See <code>lattice::xyplot()</code> . Here, we are passing an additional variable, <code>z</code> , which is then used in <code>panel.bubbleplot()</code> .
groups	See <code>lattice::xyplot()</code>
subset	See <code>lattice::xyplot()</code>
drop.unused.levels	See <code>lattice::xyplot()</code>
outer	Ignored.
allow.multiple	Ignored.

### Value

An object of class "trellis". The `update` method can be used to update components of the object and the `print` method (usually called by default) will plot it on an appropriate plotting device.

### Author(s)

Johan Larsson

### Examples

```
bubbleplot(displ ~ hp * wt, groups = cyl, data = mtcars, auto.key = TRUE)
bubbleplot(displ ~ hp * mpg | factor(cyl), groups = gear, data = mtcars,
           auto.key = TRUE)
```

---

 bwplot2

*An extended box and whiskers plot*

---

### Description

An extended version of `lattice::bwplot()`. The only modification is to group and stack box plots if `groups` is provided.

### Usage

```
bwplot2(x, data = NULL, ...)

## S3 method for class 'formula'
bwplot2(x, data = NULL, allow.multiple = is.null(groups)
       || outer, outer = FALSE, auto.key = FALSE, groups = NULL,
```

```

drop.unused.levels = lattice.getOption("drop.unused.levels"), ...,
subset = TRUE)

## S3 method for class 'numeric'
bwplot2(x, data = NULL, xlab = deparse(substitute(x)),
...)

```

### Arguments

x	see <a href="#">lattice::bwplot()</a>
data	see <a href="#">lattice::bwplot()</a>
...	arguments passed down to <a href="#">lattice::bwplot()</a>
allow.multiple	see <a href="#">lattice::bwplot()</a>
outer	see <a href="#">lattice::bwplot()</a>
auto.key	see <a href="#">lattice::bwplot()</a>
groups	see <a href="#">lattice::bwplot()</a>
drop.unused.levels	see <a href="#">lattice::bwplot()</a>
subset	see <a href="#">lattice::bwplot()</a>
xlab	see <a href="#">lattice::bwplot()</a>

### Value

An object of class "trellis". The [update](#) method can be used to update components of the object and the [print](#) method (usually called by default) will plot it on an appropriate plotting device.

### Examples

```

bwplot2(variety ~ yield,
        groups = site,
        data = barley,
        par.settings = tactile.theme())

```

---

diag.panel.splom.density

*Diagonal Density Panels*

---

### Description

Plots univariate density estimates to be used in a [lattice::splom\(\)](#) call with the `diag.panel` argument.

### Usage

```

diag.panel.splom.density(x, bw = "nrd0", adjust = 1, kernel = "gaussian",
weights = NULL, n = 512, ...)

```

**Arguments**

x	data vector corresponding to that row / column (which will be the same for diagonal 'panels').
bw	<p>the smoothing bandwidth to be used. The kernels are scaled such that this is the standard deviation of the smoothing kernel. (Note this differs from the reference books cited below, and from S-PLUS.)</p> <p>bw can also be a character string giving a rule to choose the bandwidth. See <a href="#">bw.nrd</a>.</p> <p>The default, "nrd0", has remained the default for historical and compatibility reasons, rather than as a general recommendation, where e.g., "SJ" would rather fit, see also Venables and Ripley (2002).</p> <p>The specified (or computed) value of bw is multiplied by adjust.</p>
adjust	the bandwidth used is actually <code>adjust*bw</code> . This makes it easy to specify values like 'half the default' bandwidth.
kernel	<p>a character string giving the smoothing kernel to be used. This must partially match one of "gaussian", "rectangular", "triangular", "epanechnikov", "biweight", "cosine" or "optcosine", with default "gaussian", and may be abbreviated to a unique prefix (single letter).</p> <p>"cosine" is smoother than "optcosine", which is the usual 'cosine' kernel in the literature and almost MSE-efficient. However, "cosine" is the version used by S.</p>
weights	numeric vector of non-negative observation weights, hence of same length as x. The default NULL is equivalent to <code>weights = rep(1/nx, nx)</code> where nx is the length of (the finite entries of) <code>x[]</code> .
n	the number of equally spaced points at which the density is to be estimated. When <code>n &gt; 512</code> , it is rounded up to a power of 2 during the calculations (as <code>fft</code> is used) and the final result is interpolated by <code>approx</code> . So it almost always makes sense to specify n as a power of two.
...	Further arguments passed on to <code>lattice::diag.panel.splom()</code> and <code>lattice::panel.lines()</code> .

**See Also**

[lattice::diag.panel.splom\(\)](#), [lattice::splom\(\)](#), [stats::density\(\)](#).

**Examples**

```
splom(~ iris[1:4],
      data = iris,
      diag.panel = diag.panel.splom.density,
      pscales = 0)
```

---

feldspar

*Ternary feldspar experiments and thermodynamic models*

---

### Description

A data set that has been manually transcribed from Table 5 of Elkins and Grove's *Ternary feldspar experiments and thermodynamic models*.

### Usage

feldspar

### Format

A data frame of 40 rows and 7 columns:

**Experiment** The ID of the experiment

**Feldspar** Coexisting feldspars, *Alkali* or *Plagioclase*

**Or** Proportion of orthoclase

**An** Proportion of anorthite

**Ab** Proportion of albite

**Temperature** Temperature of the reaction (degrees centigrade)

**Pressure** Pressure of the reaction (bars)

### Abstract

This paper reports the results of 20 experiments in which mixes of two or three feldspars were reacted to produce coexisting plagioclase feldspar (PF) and alkali feldspar (AF). Starting materials with similar bulk compositions were prepared using different combinations of two and three minerals, and experiments were designed to produce similar AF and PF minerals in the experimental products from different starting binary and ternary compositions. The coexisting AF and PF compositions produced as products define compositional fields that are elongate parallel to the ternary solvus. In 11 experiments reaction was sufficient to product fields of coexisting AF and PF, or AF, PF, and melt with a bulk composition close to that of the starting mixture. In six experiments significant reaction occurred in the form of reaction rim overgrowths on seeds of the starting materials. Three experiments produced AF, PF, and melt from a natural granite starting material. A two-feldspar thermometer is presented in which temperature is constrained by equilibria among all three components - Albite, Orthoclase, and Anorthite - in coexisting ternary feldspars.

---

panel.bubbleplot      *Panel Function for Bubble Plots*

---

### Description

Panel Function for Bubble Plots

### Usage

```
panel.bubbleplot(x, y, z, groups = NULL, subscripts, cex = NULL, ...)
```

### Arguments

x	variables to be plotted in the scatterplot
y	variables to be plotted in the scatterplot
z	A numeric vector that areas of circles will be mapped to.
groups	Grouping variable (see <a href="#">lattice::xyplot()</a> ).
subscripts	A vector of indexes to specify which observation to plot. Normally does not need to be provided by the user.
cex	Is used internally and user settings will be ignored.
...	Further arguments to pass to <a href="#">lattice::panel.xyplot()</a> .

### Value

Plots a layer inside a panel of a lattice plot.

---

panel.ci      *Panel function for confidence interval*

---

### Description

Panel function for confidence interval

### Usage

```
panel.ci(x, y, lower, upper, groups = NULL, subscripts, col, fill = if
(is.null(groups)) plot.line$col else superpose.line$col, alpha = 0.15,
lty = 0, lwd = if (is.null(groups)) plot.line$lwd else superpose.line$lwd,
grid = FALSE, ..., col.line = if (is.null(groups)) plot.line$col else
superpose.line$col)
```

**Arguments**

x	variables to be plotted in the scatterplot
y	variables to be plotted in the scatterplot
lower	lower confidence limits
upper	upper confidence limits
groups	an optional grouping variable. If present, <code>panel.superpose</code> will be used instead to display each subgroup
subscripts	see <code>lattice::xyplot()</code>
col	default colours are obtained from <code>plot.symbol</code> and <code>plot.line</code> using <code>trellis.par.get</code> .
fill	other graphical parameters. <code>fill</code> serves the purpose of <code>bg</code> in <code>points</code> for certain values of <code>pch</code>
alpha	opacity for the fill
lty	other graphical parameters. <code>fill</code> serves the purpose of <code>bg</code> in <code>points</code> for certain values of <code>pch</code>
lwd	other graphical parameters. <code>fill</code> serves the purpose of <code>bg</code> in <code>points</code> for certain values of <code>pch</code>
grid	A logical flag, character string, or list specifying whether and how a background grid should be drawn. This provides the same functionality as <code>type="g"</code> , but is the preferred alternative as the effect <code>type="g"</code> is conceptually different from that of other <code>type</code> values (which are all data-dependent). Using the <code>grid</code> argument also allows more flexibility.  Most generally, <code>grid</code> can be a list of arguments to be supplied to <code>panel.grid</code> , which is called with those arguments. Three shortcuts are available:  TRUE: roughly equivalent to <code>list(h = -1, v = -1)</code> "h": roughly equivalent to <code>list(h = -1, v = 0)</code> "v": roughly equivalent to <code>list(h = 0, v = -1)</code>  No grid is drawn if <code>grid = FALSE</code> .
...	Extra arguments, if any, for <code>panel.xyplot</code> . In most cases <code>panel.xyplot</code> ignores these. For types "r" and "smooth", these are passed on to <code>panel.lmline</code> and <code>panel.loess</code> respectively.
col.line	default colours are obtained from <code>plot.symbol</code> and <code>plot.line</code> using <code>trellis.par.get</code> .

**Examples**

```

mod <- lm(Petal.Width ~ Petal.Length*Species, data = iris)
newdat <- expand.grid(Petal.Length = seq(1, 7, by = 0.1),
                    Species = c("setosa", "versicolor", "virginica"))
pred <- predict(mod, newdat, interval = "confidence")
dd <- cbind(newdat, pred)

xyplot(fit ~ Petal.Length, groups = Species, data = dd,
       prepanel = prepanel.ci, auto.key = list(lines = TRUE, points = FALSE),
       ylab = "Petal Width",
       xlab = "Petal Length",

```

```

lower = dd$lwr, upper = dd$upr, type = "l",
panel = function(...) {
  panel.ci(..., alpha = 0.15, grid = TRUE)
  panel.xyplot(...)
})

```

---

panel.qqmathci

*Q-Q Diagram Confidence Intervals Panels*

---

### Description

Panel function to go along with `lattice::qqmath()` and `lattice::panel.qqmathline()`. Adds filled confidence bands to the Q-Q-plot.

### Usage

```

panel.qqmathci(x, y = x, distribution = qnorm, probs = c(0.25, 0.75),
  qtype = 7, groups = NULL, ci = 0.95, alpha = 0.25,
  col = trellis.par.get("plot.line")$col, ..., col.line)

```

### Arguments

x	The original sample, possibly reduced to a fewer number of quantiles, as determined by the <code>f.value</code> argument to <code>qqmath</code>
y	an alias for <code>x</code> for backwards compatibility
distribution	quantile function for reference theoretical distribution.
probs	numeric vector of length two, representing probabilities. Corresponding quantile pairs define the line drawn.
qtype	the type of quantile computation used in <a href="#">quantile</a>
groups	optional grouping variable. If non-null, a line will be drawn for each group.
ci	Confidence level
alpha	Alpha level for the color fill
col	Color fill for the confidence bands.
...	Arguments passed to <code>lattice::panel.superpose()</code> and <code>lattice::panel.polygon()</code>
col.line	Color fill for the confidence bands. Is used internally by <code>lattice::panel.superpose()</code> and should generally not be changed.

### Details

The function tries to figure out the density function counterpart to that provided in the argument `distribution` by regular expressions.

### Value

Augments a trellis plot panel, such as that created by `lattice::qqmath()`, with confidence levels.

**Author(s)**

Johan Larsson.

**See Also**

[lattice::panel.qqmathline\(\)](#), [lattice::qqmath\(\)](#), and [lattice::panel.qqmath\(\)](#).

**Examples**

```
qqmath(~ height | voice.part, aspect = "xy", data = singer,
       prepanel = prepanel.qqmathline,
       panel = function(x, ...) {
         panel.qqmathci(x, ...)
         panel.qqmathline(x, ...)
         panel.qqmath(x, ...)
       })
```

---

panel.ternaryplot      *Panel Function for Ternary Plots*

---

**Description**

Panel Function for Ternary Plots

**Usage**

```
panel.ternaryplot(x, y, z, subscripts, response = NULL, density = FALSE,
                 region = density || !is.null(response), contour = density ||
                 !is.null(response), labels = !is.null(response), points = TRUE,
                 grid = TRUE, density_breaks = NULL, xlab, ylab, zlab, xlab.default,
                 ylab.default, zlab.default, ...)
```

**Arguments**

x	Numeric vector
y	Numeric vector
z	Numeric vector
subscripts	See <a href="#">lattice::panel.xyplot()</a> .
response	An optional response variable
density	Compute two-dimensional density estimates via <a href="#">MASS::kde2d()</a> .
region	Fill density or response estimates with a color gradient.
contour	Draw contour lines for density and response estimates.
labels	Label contour lines.
points	Draw points (via <a href="#">panel.ternaryplot.xyplot()</a> ).
grid	Draw a reference grid.

density_breaks	Breaks for the density plot if used (see <a href="#">panel.ternaryplot.density()</a> ).
xlab	X axis label (the left dimension)
ylab	Y axis label (the right dimension)
zlab	Z axis label (the top dimension)
xlab.default	Internal argument
ylab.default	Internal argument
zlab.default	Internal argument
...	Arguments passed down to subsequent panel functions.

**Value**

Plots a layer inside a panel of a lattice plot.

**See Also**

The building blocks of this function are available as the separate panel functions [panel.ternaryplot.xyplot\(\)](#), [panel.ternaryplot.grid\(\)](#), [panel.ternaryplot.scales\(\)](#), [panel.ternaryplot.clip\(\)](#), [panel.ternaryplot.resp](#) and [panel.ternaryplot.density\(\)](#) in case the user would like to get complete control of the customization.

---

panel.ternaryplot.clip

*Plot Region Clipping for Ternary Plots*

---

**Description**

Plot Region Clipping for Ternary Plots

**Usage**

```
panel.ternaryplot.clip(xl = current.panel.limits()$x,
  yl = current.panel.limits()$y, border = "transparent", col = if
  (background$col == "transparent") "#FFFFFF" else background$col)
```

**Arguments**

xl	X axis limits
yl	Y axis limits
border	Border color
col	Polygon fill

**Value**

Plots a layer inside a panel of a lattice plot.

---

panel.ternaryplot.density

*Two-Dimensional Density Estimation for Ternary Plots*

---

### Description

Two-Dimensional Density Estimation for Ternary Plots

### Usage

```
panel.ternaryplot.density(x, y, z, subscripts, n = 100, region = TRUE,
  contour = FALSE, labels = isTRUE(contour), density_breaks = NULL, ...)
```

### Arguments

x	Numeric vector
y	Numeric vector
z	Numeric vector
subscripts	See <a href="#">lattice::panel.xyplot()</a> .
n	Number of grid points in each direction. Can be scalar or a length-2 integer vector.
region	Fill density or response estimates with a color gradient.
contour	Draw contour lines for density and response estimates.
labels	Label contour lines.
density_breaks	Breaks for the density plot if used (see <a href="#">panel.ternaryplot.density()</a> ).
...	Arguments that will be passed on to <a href="#">lattice::panel.lines()</a> , <a href="#">lattice::panel.polygon()</a> , and <a href="#">lattice::panel.text()</a> .

### Value

Plots a layer inside a panel of a lattice plot.

---

panel.ternaryplot.grid

*Reference Grid for Ternary Plot*

---

### Description

Reference Grid for Ternary Plot

**Usage**

```
panel.ternaryplot.grid(at = seq.int(0, 1, by = 0.2),
  alpha = reference.line$alpha, col = reference.line$col,
  lty = reference.line$lty, lwd = reference.line$lwd)
```

**Arguments**

at	Where to draw the reference lines
alpha	Alpha
col	Color
lty	Line type
lwd	Line weight

**Value**

Plots a layer inside a panel of a lattice plot.

---

panel.ternaryplot.response

*Response Panels for Ternary Plots*

---

**Description**

Response Panels for Ternary Plots

**Usage**

```
panel.ternaryplot.response(x, y, z, subscripts, response, region = TRUE,
  contour = TRUE, labels = isTRUE(contour), fun = c("glm", "lm"),
  formula = response ~ poly(x, y), ...)
```

**Arguments**

x	Numeric vector
y	Numeric vector
z	Numeric vector
subscripts	See <a href="#">lattice::panel.xyplot()</a> .
response	An optional response variable
region	Fill density or response estimates with a color gradient.
contour	Draw contour lines for density and response estimates.
labels	Label contour lines.
fun	Function to apply to the response variable.
formula	Formula for the function.
...	Arguments passed on to <a href="#">lattice::panel.lines()</a> , <a href="#">lattice::panel.polygon()</a> , <a href="#">lattice::panel.text()</a> .

**Value**

Plots a layer inside a panel of a lattice plot.

---

panel.ternaryplot.scales  
*Axes and Labels for Ternary Plots*

---

**Description**

Axes and Labels for Ternary Plots

**Usage**

```
panel.ternaryplot.scales(xlab, ylab, zlab, xlab.default, ylab.default,  
  zlab.default, at = seq.int(0, 1, by = 0.2), ...)
```

**Arguments**

xlab	Labels, have to be lists. Typically the user will not manipulate these, but instead control this via arguments to <code>cld</code> directly.
ylab	Labels, have to be lists. Typically the user will not manipulate these, but instead control this via arguments to <code>cld</code> directly.
zlab	Labels, have to be lists. Typically the user will not manipulate these, but instead control this via arguments to <code>cld</code> directly.
xlab.default	for internal use
ylab.default	for internal use
zlab.default	for internal use
at	Where to draw tick marks.
...	Currently ignored.

**Value**

Plots a layer inside a panel of a lattice plot.

---

panel.ternaryplot.xyplot

*Ternary Plot Wrapper for lattice::xyplot*

---

**Description**

This mainly exists to enable users to string together their own ternary plot functions.

**Usage**

```
panel.ternaryplot.xyplot(x, y, z, subscripts, ...)
```

**Arguments**

x	Numeric vector of values in the original space
y	Numeric vector of values in the original space
z	Numeric vector of values in the original space
subscripts	see <a href="#">lattice::xyplot()</a> .
...	Arguments that are passed on to <a href="#">lattice::panel.xyplot()</a> .

**Value**

Plots a layer inside a panel of a lattice plot.

---

prepanel.ci

*Prepanel for ciplot***Description**

Prepanel for ciplot

**Usage**

```
prepanel.ci(x, y, lower, upper, subscripts, groups = NULL, ...)
```

**Arguments**

x	x and y values, numeric or factor
y	x and y values, numeric or factor
lower	lower confidence limits
upper	upper confidence limits
subscripts	See <a href="#">xyplot</a> . Whenever appropriate, calculations are done separately for each group and then combined.
groups	See <a href="#">xyplot</a> . Whenever appropriate, calculations are done separately for each group and then combined.
...	other arguments, usually ignored

**Examples**

```

mod <- lm(Petal.Width ~ Petal.Length*Species, data = iris)
newdat <- expand.grid(Petal.Length = seq(1, 7, by = 0.1),
                     Species = c("setosa", "versicolor", "virginica"))
pred <- predict(mod, newdat, interval = "confidence")
dd <- cbind(newdat, pred)

xyplot(fit ~ Petal.Length, groups = Species, data = dd,
       prepanel = prepanel.ci,
       ylab = "Petal Width",
       xlab = "Petal Length",
       lower = dd$lower, upper = dd$upper, alpha = 0.3,
       panel = function(...) {
         panel.ci(..., grid = TRUE)
         panel.xyplot(type = "l", ...)
       })

```

---

qqmath.zoo

*Q-Q Plots for Zoo Objects*

---

**Description**

Draw quantile-Quantile plots of a sample against a theoretical distribution, possibly conditioned on other variables.

**Usage**

```

## S3 method for class 'zoo'
qqmath(x, data = NULL, xlab = "Theoretical quantiles",
       ylab = "Sample quantiles", ref = TRUE, ci = TRUE, ...)

```

**Arguments**

x	A zoo object
data	Ignored
xlab	X axis label
ylab	Y axis label
ref	Plot a reference line via <code>lattice::panel.qqmathline()</code> .
ci	Plot confidence levels via <code>panel.qqmathci()</code> .
...	Parameters to pass on to <code>lattice::qqmath()</code> .

**Value**

Plots and returns a trellis object.

**Author(s)**

Original by Deepayan Sarkar.

**See Also**

[lattice::qqmath\(\)](#), [zoo::zoo\(\)](#), [lattice::panel.qqmathline\(\)](#).

**Examples**

```
if (require(zoo))
  qqmath(zoo(1h))
```

---

tactile.theme

*Tactile Theme*

---

**Description**

A custom theme for lattice that tries to make away with some of the (in this author's opinion) excessive margins that result from the default settings. It also provides a different color theme based partly on [latticeExtra::custom.theme\(\)](#).

**Usage**

```
tactile.theme(fontsize = c(12, 8), color = TRUE, ...)
```

**Arguments**

fontsize	A vector of two numeric scalars for text and symbols respectively.
color	Colorized theme.
...	Additional named options.

**Details**

The theme currently modifies the default lattice theme so that

- paddings (margins) are minimized,
- axis tick lengths are halved, and
- title size is decreased *slightly*.

**Value**

A list of graphical parameters that for instance could be supplied inside a call to [lattice::xyplot\(\)](#) or set via [lattice::lattice.options\(\)](#).

## Examples

```
xyplot(speed ~ dist, data = cars, par.settings = tactile.theme())
opars <- trellis.par.get()
trellis.par.set(tactile.theme())
show.settings()
trellis.par.set(opars)
```

---

 ternaryplot

*Ternary Plot*

---

## Description

A ternary plot is a triangular diagram that displays proportions of three variables. It can be used to map three-dimensional data to a two-dimensional surface with the caveat that the data's original scales are lost (unless it was proportional data to begin with).#'

## Usage

```
ternaryplot(x, data, ...)

## S3 method for class 'formula'
ternaryplot(x, data = NULL, response = NULL,
  groups = NULL, density = FALSE, region = density || !is.null(response),
  contour = density || !is.null(response), labels = !is.null(response),
  colorkey = region, xlab, ylab, zlab, xlim = c(-0.15, 1.15),
  ylim = c(-0.3, 1), panel = panel.ternaryplot,
  default.prepanel = lattice.getOption("prepanel.default.xyplot"),
  drop.unused.levels = lattice.getOption("drop.unused.levels"),
  subset = TRUE, ...)

## S3 method for class 'data.frame'
ternaryplot(x, data = NULL, ...)

## S3 method for class 'matrix'
ternaryplot(x, data = NULL, ...)
```

## Arguments

x	See <b>Methods (by class)</b> .
data	A data frame in which the formula, groups, and conditioning variables are evaluated.
...	Arguments that are passed on to other methods, particularly <a href="#">panel.ternaryplot()</a> .
response	An optional response variable
groups	A variable or expression to be evaluated in data and used to distinguish groups by varying graphical parameters.
density	Compute two-dimensional density estimates via <a href="#">MASS::kde2d()</a> .

region	Fill density or response estimates with a color gradient.
contour	Draw contour lines for density and response estimates.
labels	Label contour lines.
colorkey	if TRUE automatically computes a colorkey for density or response estimates. Can also be a list (see <code>lattice::levelplot()</code> for details on this).
xlab	X axis label (the left dimension)
ylab	Y axis label (the right dimension)
zlab	Z axis label (the top dimension)
xlim	X limits for the plot region.
ylim	Y limits for the plot region.
panel	The panel function.
default.prepanel	The default prepanel function.
drop.unused.levels	Drop unused conditioning or groups levels.
subset	An expression that evaluates to a logical or integer indexing vector. Like groups, it is evaluated in data. Only the resulting rows of data are used for the plot.

### Value

An object of class "trellis". The `update` method can be used to update components of the object and the `print` method (usually called by default) will plot it on an appropriate plotting device.

### Methods (by class)

- `formula`: A formula of the form `top ~ left * right`. Variables will be evaluated inside data if provided.
- `data.frame`: A data frame for which the first three columns will be mapped to the *left*, *right*, and *top* dimensions of the ternary plot respectively.
- `matrix`: A matrix for which the first three columns will be mapped to the *left*, *right*, and *top* dimensions of the ternary plot respectively.

### Examples

```
ternaryplot(Fertility ~ Agriculture * Catholic, data = swiss)
ternaryplot(Catholic ~ Examination * Education, response = Infant.Mortality,
            data = swiss, contour = FALSE)

ternaryplot(Or ~ An * Ab | Feldspar, data = feldspar)

ternaryplot(Or ~ An * Ab, groups = Feldspar, data = feldspar, density = TRUE)
```

---

`xyplot.acf`*Plot Autocovariance and Autocorrelation Functions*

---

**Description**

This is a version of `stats::plot.acf()`.

**Usage**

```
## S3 method for class 'acf'  
xyplot(x, data = NULL, ci = 0.95, ci_type = c("white",  
      "ma"), ci_col = trellis.par.get("add.line")$col, ci_lty = 2, ...)
```

**Arguments**

<code>x</code>	An 'acf' object.
<code>data</code>	Ignored
<code>ci</code>	Confidence level.
<code>ci_type</code>	Type of confidence level.
<code>ci_col</code>	Line color for the confidence levels.
<code>ci_lty</code>	Line type for the confidence levels.
<code>...</code>	Arguments passed on to <code>lattice::xyplot()</code> .

**Value**

Returns and plots a trellis object.

**Author(s)**

Original by Brian Ripley.

**See Also**

`lattice::xyplot()`, `stats::plot.acf()`, `stats::acf()`.

**Examples**

```
z <- ts(matrix(rnorm(400), 100, 4), start = c(1961, 1), frequency = 12)  
xyplot(acf(z))
```

---

xyplot.Arima                      *Diagnostic Plots for ARIMA Models*

---

### Description

Diagnostic plots modelled after `stats::tsdiag()` with some modifications and corrections of p-values in the Box–Ljung test.

### Usage

```
## S3 method for class 'Arima'
xyplot(x, data = NULL, which = 1:4, lag.max = NULL,
       gof.lag = NULL, qq.aspect = "iso", na.action = na.pass, main = NULL,
       layout = NULL, ...)
```

### Arguments

<code>x</code>	A fitted time-series model of class <code>Arima</code> .
<code>data</code>	Ignored
<code>which</code>	A sequence of integers between 1 and 4, identifying the plots to be shown.
<code>lag.max</code>	Number of lags to compute ACF for.
<code>gof.lag</code>	The maximum number of lags for the Ljung–Box test.
<code>qq.aspect</code>	Aspect of Q-Q plot (see <code>lattice::qqmath()</code> ).
<code>na.action</code>	Treatment of NAs.
<code>main</code>	Optional titles for the plots. Can also be <code>TRUE</code> , in which case a default list of titles will be added.
<code>layout</code>	Either a numeric vector with (columns, rows) to use in the call to <code>gridExtra::grid.arrange()</code> , or a layout matrix which will then be passed as the <code>layout_matrix</code> in <code>grid.arrange()</code> .
<code>...</code>	Parameters to pass to <code>xyplot()</code> .

### Value

Plots a lattice plot and returns a `trellis` object.

### See Also

`stats::tsdiag()`, `stats::arima()`, `lattice::xyplot()`, `gridExtra::grid.arrange()`, `stats::Box.test()`.

### Examples

```
fit <- arima(lh, order = c(1, 1, 0))
xyplot(fit, layout = c(2, 2))
xyplot(fit, which = c(1:2, 4), layout = rbind(c(1, 1), c(2, 3)))
```

---

xyplot.forecast

*Plot Forecasts with Trellis Graphics*

---

## Description

Plot forecasts from `forecast::forecast()`. It is built mostly to resemble the `forecast::autoplot.forecast()` and `forecast::plot.forecast()` functions, but in addition tries to plot the predictions on the original scale.

## Usage

```
## S3 method for class 'forecast'
xyplot(x, data = NULL, ci = TRUE, ci_levels = x$level,
       ci_key = ci, ci_pal = hcl(0, 0, 45:100),
       ci_alpha = trellis.par.get("regions")$alpha, ...)
```

## Arguments

<code>x</code>	An object of class <code>forecast</code> .
<code>data</code>	Data of observations left out of the model fit, usually "future" observations.
<code>ci</code>	Plot confidence intervals for the predictions.
<code>ci_levels</code>	The prediction levels to plot as a subset of those forecasted in <code>x</code> .
<code>ci_key</code>	Set to <code>TRUE</code> to draw a key automatically or provide a list (if <code>length(ci_levels) &gt; 5</code> should work with <code>lattice::draw.colorkey()</code> and otherwise with <code>lattice::draw.key()</code> )
<code>ci_pal</code>	Color palette for the confidence bands.
<code>ci_alpha</code>	Fill alpha for the confidence interval.
<code>...</code>	Arguments passed on to <code>lattice::panel.xyplot()</code> .

## Details

This function requires the **zoo** package.

## Value

An object of class "trellis". The `update` method can be used to update components of the object and the `print` method (usually called by default) will plot it on an appropriate plotting device.

## See Also

`lattice::panel.xyplot()`, `forecast::forecast()`, `lattice::xyplot.ts()`.

**Examples**

```

if (require(forecast)) {
  train <- window(USAccDeaths, c(1973, 1), c(1977, 12))
  test <- window(USAccDeaths, c(1978, 1), c(1978, 12))
  fit <- arima(train, order = c(0, 1, 1),
              seasonal = list(order = c(0, 1, 1)))
  fcast1 <- forecast(fit, 12)
  xyplot(fcast1, test, grid = TRUE, auto.key = list(corner = c(0, 0.99)),
        ci_key = list(title = "PI Level"))

  # A fan plot
  fcast2 <- forecast(fit, 12, level = seq(0, 95, 10))
  xyplot(fcast2, test, ci_pal = heat.colors(100))
}

```

xyplot.lm

*Lattice plot diagnostics for lm objects***Description**

Lattice plot diagnostics for `lm` objects, mostly mimicking the behavior of `stats::plot.lm()` but based on `lattice::xyplot()` instead.

**Usage**

```

## S3 method for class 'lm'
xyplot(x, data = NULL, which = c(1:3, 5), main = FALSE,
       id.n = 3, labels.id = names(residuals(x)), cex.id = 0.75,
       cook.levels = c(0.5, 1), label.pos = c(4, 2), layout = NULL, ...)

```

**Arguments**

<code>x</code>	<code>lm</code> object, typically result of <code>lm</code> or <code>glm</code> .
<code>data</code>	Only provided for method consistency and is ignored.
<code>which</code>	if a subset of the plots is required, specify a subset of the numbers 1:6
<code>main</code>	if TRUE plots default titles. Can also be a <code>list</code> or character vector of length 6.
<code>id.n</code>	number of points to be labelled in each plot, starting with the most extreme.
<code>labels.id</code>	vector of labels, from which the labels for extreme points will be chosen. NULL uses observation numbers.
<code>cex.id</code>	magnification of point labels.
<code>cook.levels</code>	levels of Cook's distance at which to draw contours.
<code>label.pos</code>	positioning of labels, for the left half and right half of the graph respectively, for plots 1-3.
<code>layout</code>	a numeric vector with [ <code>columns</code> , <code>rows</code> ] to use in the call to <code>gridExtra::grid.arrange()</code> , or a layout matrix which will then be passed as the <code>layout_matrix</code> in <code>grid.arrange()</code> .
<code>...</code>	arguments to be passed to <code>lattice::xyplot()</code> .

**Value**

A list of trellis objects or a single trellis object.

**Author(s)**

Original by John Maindonald and Martin Maechler. Adaptation to lattice by Johan Larsson.

**See Also**

[stats::lm\(\)](#), [stats::plot.lm\(\)](#), [lattice::xyplot\(\)](#)

**Examples**

```
fit <- lm(Sepal.Length ~ Sepal.Width, data = iris)
xyplot(fit)
xyplot(fit, which = 5)
```
