

# Package ‘tipmap’

December 7, 2022

**Type** Package

**Title** Tipping Point Analysis for Bayesian Dynamic Borrowing

**Version** 0.3.9

**Description** Tipping point analysis for clinical trials that employ Bayesian dynamic borrowing via robust meta-analytic predictive (MAP) priors. Mainly an implementation of an approach proposed by Best and colleagues (2021) is provided <[doi:10.1002/pst.2093](https://doi.org/10.1002/pst.2093)>. Further functions facilitate the specification of the robust MAP prior via expert elicitation (using the roulette method) and computation of the posterior distribution of the treatment effect with either fixed or stochastic expert-elicited weights. Intended use is the planning, analysis and interpretation of extrapolation studies in pediatric drug development, but applicability is generally wider.

**License** GPL (>= 3)

**Encoding** UTF-8

**Imports** dplyr, purrr, ggplot2, RBesT

**Suggests** knitr, rmarkdown, testthat (>= 3.0.0)

**Config/testthat.edition** 3

**RoxygenNote** 7.2.1

**VignetteBuilder** knitr

**Depends** R (>= 3.5.0)

**NeedsCompilation** no

---

`create_new_trial_data` *Data on new trial in target population*

---

**Description**

Creates a vector containing data on the new trial in the target population. This may be hypothetical data in the planning stage.

**Usage**

```
create_new_trial_data(n_total, est, se)
```

**Arguments**

<code>n_total</code>	The total sample size.
<code>est</code>	Treatment effect estimate.
<code>se</code>	Standard error of the treatment effect estimate.

**Value**

A numeric vector with data on the new trial, incl. quantiles of an assumed normal data likelihood.

**See Also**

[create\\_posterior\\_data](#), [create\\_tipmap\\_data](#)

## Examples

```
new_trial_data <- create_new_trial_data(  
  n_total = 30, est = 1.27, se = 0.95  
)
```

---

`create_posterior_data` *Creates posterior distributions for a range of weights on the informative component of the robust MAP prior*

---

## Description

Returns a data frame containing the default quantiles of posterior mixture distributions generated with varying weights on the informative component of the MAP prior.

## Usage

```
create_posterior_data(map_prior, new_trial_data, sigma, null_effect = 0)
```

## Arguments

<code>map_prior</code>	A MAP prior containing information about the trial(s) in the source population, created using RBeST.
<code>new_trial_data</code>	A vector containing information about the new trial. See <code>create_new_trial_data()</code> .
<code>sigma</code>	Standard deviation to be used for the weakly informative component of the MAP prior, recommended to be the unit-information standard deviation.
<code>null_effect</code>	The mean of the robust component of the MAP prior. Defaults to 0.

## Value

A data frame containing posterior distributions for varying weights

## References

Best, N., Price, R. G., Pouliken, I. J., & Keene, O. N. (2021). Assessing efficacy in important subgroups in confirmatory trials: An example using Bayesian dynamic borrowing. *Pharm Stat*, 20(3), 551–562. <https://doi.org/10.1002/pst.2093>

## See Also

[create\\_new\\_trial\\_data](#), [create\\_prior\\_data](#)

## Examples

```
# create vector containing data on new trial
new_trial_data <- create_new_trial_data(
  n_total = 30,
  est = 1.27,
  se = 0.95
)

# read MAP prior created by RBesT
map_prior <- load_tipmap_data("tipmapPrior.rds")

# create posterior data
## Not run:
posterior_data <- create_posterior_data(
  map_prior = map_prior,
  new_trial_data = new_trial_data,
  sigma = 12
)

## End(Not run)
```

**create\_prior\_data**      *Creates input data frame for construction of MAP prior*

## Description

Assembling information from trials in the source population in a structured way (required as a pre-processing step for MAP prior creation).

## Usage

```
create_prior_data(study_label = NULL, n_total, est, se)
```

## Arguments

<code>study_label</code>	An optional vector containing trial labels.
<code>n_total</code>	A vector containing total sample sizes.
<code>est</code>	A vector containing treatment effect estimates.
<code>se</code>	A vector containing standard errors of the effect estimates.

## Value

A data frame containing data on the trials in the source population.

## See Also

[create\\_new\\_trial\\_data](#), [create\\_posterior\\_data](#)

## Examples

```
prior_data <- create_prior_data(  
  n_total = c(160, 240, 320),  
  est = c(1.23, 1.40, 1.51),  
  se = c(0.4, 0.36, 0.31)  
)
```

---

create\_tipmap\_data      *Create data frame ready to use for tipping point analysis*

---

## Description

Combines new trial data created by `createTargetData()`, a posterior distribution created by `create_posterior_data()` and a robust MAP prior using `RBesT::automixfit()` and an optional meta-analysis, e.g. created using the `meta` package, into a data frame needed for the functions `tipmap_plot()` and `get_tipping_point()`.

## Usage

```
create_tipmap_data(new_trial_data, posterior, map_prior, meta_analysis = NULL)
```

## Arguments

`new_trial_data` A data frame containing data on the new trial in the target population. See `create_new_trial_data()`.  
`posterior` A mixture combining MAP prior and target population. See `create_posterior_data()`.  
`map_prior` A robust MAP prior created by `RBesT::automixfit()`.  
`meta_analysis` A data frame containing a meta-analysis of trial(s) to be borrowed from. See `createPriorData()`.

## Value

A data frame ready to be used for `tipmap_plot()` and `get_tipping_point()`

## See Also

[create\\_new\\_trial\\_data](#), [create\\_posterior\\_data](#), [tipmap\\_plot](#), [get\\_tipping\\_points](#)

## Examples

```
# specify new trial data  
new_trial_data <- create_new_trial_data(n_total = 30, est = 1.5, se = 2.1)  
  
# read MAP prior data  
map_prior <- load_tipmap_data("tipmapPrior.rds")
```

```
# read posterior data
posterior <- load_tipmap_data("tipPost.rds")

tip_dat <- create_tipmap_data(
  new_trial_data = new_trial_data,
  posterior = posterior,
  map_prior = map_prior
)
```

---

default\_quantiles      *Default quantiles*

---

**Description**

Default quantiles

**Usage**

```
default_quantiles
```

**Format**

An object of class `numeric` of length 13.

---

default\_weights      *Default weights*

---

**Description**

Default weights

**Usage**

```
default_weights
```

**Format**

An object of class `numeric` of length 201.

---

`draw_beta_mixture_1sample`

*Draw a single sample from a mixture of beta distributions*

---

## Description

Internal function needed for expert elicitation methods.

## Usage

```
draw_beta_mixture_1sample(params, weights = NULL)
```

## Arguments

<code>params</code>	Dataframe with parameters of beta distributions. Parameters need to be provided in columns named "alpha" and "beta", respectively, i.e. with one row per distribution).
<code>weights</code>	Optional vector of weights assigned to experts. Defaults to equal weights.

## Value

One draw (numeric value) from a mixture of beta distributions.

## Examples

```
beta_fits <- fit_beta_mult_exp(
  chips_mult =
    rbind(
      c(0, 0, 0, 0, 2, 3, 3, 2, 0, 0),
      c(0, 0, 0, 1, 2, 4, 2, 1, 0, 0),
      c(0, 0, 0, 2, 2, 2, 2, 2, 0, 0)
    )
)
draw_beta_mixture_1sample(beta_fits)
```

---

`draw_beta_mixture_nsamples`

*Draw n samples from a mixture of beta distributions*

---

## Description

Draws samples from a mixture of beta distributions, representing pooled weights on the informative component of a robust MAP prior, as elicited from experts via the roulette method.

**Usage**

```
draw_beta_mixture_nsamples(n, chips_mult, weights = NULL)
```

**Arguments**

- n** The number of samples to be drawn.
- chips\_mult** A data frame or matrix containing expert weights. Rows should represent experts, columns should represent bins / weights.
- weights** An optional vector containing the weight assigned to each expert. Defaults to equal weights.

**Value**

A numeric vector containing samples from a pooled distribution of expert opinions.

**Examples**

```
rweights <- draw_beta_mixture_nsamples(
  n = 50,
  chips_mult = rbind(
    c(0, 0, 0, 2, 3, 3, 2, 0, 0),
    c(0, 0, 1, 2, 4, 2, 1, 0, 0),
    c(0, 0, 2, 2, 2, 2, 2, 0, 0)
  ))
rweights
```

---

**fit\_beta\_1exp**

*Fit beta distribution for one expert*

---

**Description**

Fit beta distribution to weights elicited from one expert via the roulette method.

**Usage**

```
fit_beta_1exp(df)
```

**Arguments**

- df** A dataframe generated by `get_model_input_1exp`.

**Details**

This function is based on `SHELF::fitdist` and yields identical results.

**Value**

Parameters of beta fit.

**Examples**

```
chips <- c(0, 2, 3, 2, 1, 1, 1, 0, 0, 0)
x <- get_cum_probs_1exp(chips)
y <- get_model_input_1exp(x)
fit_beta_1exp(df = y)$par
```

fit_beta_mult_exp	<i>Fit beta distributions for multiple experts</i>
-------------------	--

**Description**

Fit beta distributions to weights elicited from multiple experts via the roulette method.

**Usage**

```
fit_beta_mult_exp(chips_mult)
```

**Arguments**

chips_mult	A dataframe or matrix containing weights. It should contain one row per expert and 10 columns, one for each bin, representing weights from 0 to 1.
------------	--

**Value**

Parameters of the individual beta distributions.

**Examples**

```
beta_fits <- fit_beta_mult_exp(
  chips_mult =
    rbind(
      c(0, 0, 0, 0, 2, 3, 3, 2, 0, 0),
      c(0, 0, 0, 1, 2, 4, 2, 1, 0, 0),
      c(0, 0, 0, 2, 2, 2, 2, 2, 0, 0)
    )
)
beta_fits
```

get\_cum\_probs\_1exp     *Get cumulative probabilities from distribution of chips of one expert*

### Description

Internal function needed for expert elicitation methods.

### Usage

```
get_cum_probs_1exp(chips)
```

### Arguments

chips	A numeric vector representing the distribution of chips of one expert. The vector must be of length 10 and contents must add up to 10. The first column represents weight on interval 0 to 0.1.
-------	---

### Value

A vector of cumulative probabilities.

### Examples

```
chips <- c(0,2,3,2,1,1,1,0,0,0)
x <- get_cum_probs_1exp(chips)
x
```

get\_model\_input\_1exp     *Transform cumulative probabilities to fit beta distributions*

### Description

Internal function needed for expert elicitation methods.

### Usage

```
get_model_input_1exp(cum_probs, w = NULL)
```

### Arguments

cum_probs	Cumulative probabilities of weights of one expert.
w	Weight of bins.

### Value

Dataframe that can be used as input to fit beta distributions by `fit_beta_1exp()`.

## Examples

```
chips <- c(0,2,3,2,1,1,1,0,0,0)
x <- get_cum_probs_1exp(chips)
y <- get_model_input_1exp(x)
y
```

---

### get\_posterior\_by\_weight

*Filter posterior by given weights*

---

## Description

Returns quantiles of the posterior distribution of the treatment effect for one or more specified weights.

## Usage

```
get_posterior_by_weight(posterior, weight)
```

## Arguments

posterior	The posterior data to be filtered (see <code>create_posterior_data()</code> ).
weight	The weight(s) to be filtered by.

## Value

The filtered posterior values

## See Also

[create\\_posterior\\_data](#)

## Examples

```
get_posterior_by_weight(
  posterior = load_tipmap_data("tipPost.rds"),
  weight = c(0.05, 0.1)
)
```

**get\_stochast\_weight\_posterior**

*Computation of posterior distribution using weights sampled from a distribution of weights*

**Description**

Performs repeated analyses with weights on the informative component of the MAP prior randomly drawn from a distribution of weights and combines samples from all posteriors.

**Usage**

```
get_stochast_weight_posterior(
  map_prior,
  new_trial_dat,
  weights,
  n_posterior_samples,
  null_effect = 0,
  sigma
)
```

**Arguments**

<code>map_prior</code>	The MAP prior to be robustified, created using <code>RBesT::automixfit()</code> .
<code>new_trial_dat</code>	A vector summarising the new trial data. See <code>createNewTrialData()</code> .
<code>weights</code>	A vector containing the weights to be assigned to the informative component.
<code>n_posterior_samples</code>	The number of samples to be drawn from each posterior.
<code>null_effect</code>	The null treatment effect. Defaults to 0.
<code>sigma</code>	Unit information standard deviation used by <code>RBesT::robustify()</code> .

**Value**

Sample of the posterior distribution.

**See Also**

[create\\_new\\_trial\\_data](#), [draw\\_beta\\_mixture\\_nsamples](#).

**Examples**

```
# MAP prior
(map_prior <- load_tipmap_data("tipmapPrior.rds"))
summary(map_prior)
```

```

# New trial data in target population
new_trial_dat <- create_new_trial_data(
  n_total = 30, est = 1.17, se = 0.95
)

# Expert weights
expert_weights <- rbind(
  c(0, 0, 0, 0, 1, 3, 3, 2, 1, 0),
  c(0, 0, 1, 1, 2, 2, 3, 1, 0, 0),
  c(0, 0, 0, 0, 2, 3, 2, 2, 1, 0)
)
set.seed(123)
sampled_weights <- draw_beta_mixture_nsamples(expert_weights, n = 500)
(m_w <- round(mean(sampled_weights), 2)) # 0.59

# Posterior based on mean weight
robust_mix_prior <- RBesT::robustify(
  priormix = map_prior,
  weight = (1 - m_w),
  n = 1,
  mean = 0,
  sigma = 12
)
posterior1 <- RBesT::postmix(
  priormix = robust_mix_prior,
  m = new_trial_dat["mean"],
  se = new_trial_dat["se"]
)

# Posterior based on a sample of weights
posterior2 <- get_stochast_weight_posterior(
  map_prior = map_prior,
  new_trial_dat = new_trial_dat,
  weights = sampled_weights,
  n_posterior_samples = 500,
  sigma = 12
)
summary_posterior2 <- c(mean(posterior2), sd(posterior2),
  quantile(posterior2, probs = c(0.025, 0.5, 0.975)))
names(summary_posterior2) <- c("mean", "sd", "2.5%", "50.0%", "97.5%")

# Comparison of posterior 1 and 2
summary(posterior1)
print(summary_posterior2)

```

get\_summary\_mult\_exp    Summarize expert weights

### Description

Computes minimum, maximum, mean and quartiles for expert weights.

**Usage**

```
get_summary_mult_exp(chips_mult, n = 500, weights = NULL)
```

**Arguments**

- chips\_mult** A data frame or matrix containing expert weights.  
**n** The number of samples to be drawn to obtain summary statistics. Defaults to 500.  
**weights** Weights assigned to each expert. Defaults to equal weights.

**Value**

A vector containing summary statistics.

**Examples**

```
get_summary_mult_exp(rbind(
  c(0, 0, 0, 0, 2, 3, 3, 2, 0, 0),
  c(0, 0, 0, 1, 2, 4, 2, 1, 0, 0),
  c(0, 0, 0, 2, 2, 2, 2, 2, 0, 0)
))
```

**get\_tipping\_points** *Identify tipping point for a specific quantile.*

**Description**

Identifies the weights closest to tipping points for specified quantiles.

**Usage**

```
get_tipping_points(tipmap_data, quantile, null_effect = 0)
```

**Arguments**

- tipmap\_data** A data frame created by `create_tipmap_data()`.  
**quantile** The quantile(s) of the tipping point. Possible values are 0.025, 0.05, 0.1, 0.2, 0.8, 0.9, 0.95 and 0.975.  
**null\_effect** The null treatment effect. Defaults to 0.

**Value**

The weight closest to the tipping point for the specified quantile

**See Also**

[create\\_tipmap\\_data](#)

**Examples**

```
tip_dat <- load_tipmap_data("tipdat.rds")#
get_tipping_points(tip_dat, quantile = 0.025)
get_tipping_points(tip_dat, quantile = c(0.025, 0.05, 0.1, 0.2), null_effect = 0.1)
```

---

load\_tipmap\_data      *Load exemplary datasets*

---

**Description**

Loads one of three exemplary datasets in the package.

**Usage**

```
load_tipmap_data(file)
```

**Arguments**

file            The dataset to be loaded.

**Value**

A pre-saved dataset.

**Examples**

```
load_tipmap_data(file = "tipdat.rds")
load_tipmap_data(file = "tipmapPrior.rds")
load_tipmap_data(file = "tipPost.rds")
```

---

tipmap\_darkblue      *Custom dark blue*

---

**Description**

Custom dark blue

**Usage**

```
tipmap_darkblue
```

**Format**

An object of class character of length 1.

`tipmap_lightred`      *Custom light red*

### Description

Custom light red

### Usage

`tipmap_lightred`

### Format

An object of class `character` of length 1.

`tipmap_plot`      *Visualize tipping point analysis*

### Description

Uses a data frame created by `create_tipmap_data()` to visualize the tipping point analysis.

### Usage

```
tipmap_plot(
  tipmap_data,
  target_pop_lab = "Trial in target\n population",
  y_range = NULL,
  y_breaks = NULL,
  title = NULL,
  y_lab = "Mean difference",
  x_lab = "Weight on informative component of MAP prior",
  map_prior_lab = "MAP\nnprior",
  meta_analysis_lab = "MA",
  legend_title = "Posterior quantile",
  null_effect = 0
)
```

### Arguments

- `tipmap_data`      A data frame containing tipping point data, generated by `create_tipmap_data()`.
- `target_pop_lab`      A label for the trial in the target population.
- `y_range`      An optional argument specifying range of the y-axis.
- `y_breaks`      An optional vector specifying breaks on the y-axis.

title	The plot title.
y_lab	The label for the y axis. Defaults to "Mean difference".
x_lab	The label for the x axis. Defaults to "Weight on informative component of MAP prior".
map_prior_lab	The label for the MAP prior. Defaults to "MAP prior"
meta_analysis_lab	An optional label for a meta-analysis (if included).
legend_title	An optional title for the plot legend. Defaults to "Posterior quantiles".
null_effect	The null treatment effect, determining where tipping points are calculated. Defaults to 0.

**Value**

A ggplot object of the tipping point plot

**See Also**

[create\\_tipmap\\_data](#)

**Examples**

```
tipmap_data <- load_tipmap_data("tipdat.rds")
tipmap_plot(tipmap_data)
```
